Subject Description Form

Subject Code	AMA3100				
Subject Title	Number, Combinatorics and Statistics				
Credit Value	3				
Level	3				
Pre-requisite/ Co-requisite/ Exclusion	Nil				
Objectives	 Introduce to students the necessary mathematical background for the understanding of modern information security measures Equip students with knowledge of basic number theory, combinatorics and statistical methods Introduce the applications of these theories in the area of information security 				
Intended Subject	Upon completion of the subject, students will be able to:				
Learning Outcomes	 <u>Category A: Professional/academic knowledge and skills</u> 1. Understand number theory as the background of modern cryptography 2. Understand statistical methods and their applications to the area of information security 3. Understand combinatorial mathematics <u>Category B: Attributes for all-Roundedness</u> 4. Recognise the need for continuing development 				
Contribution of the	Programme Outcomes:				
Subject to the Attainment of the Programme Outcomes	 <u>Category A: Professional/academic knowledge and skills</u> Programme Outcome 1: This subject contributes to the knowledge of mathematics necessary to the discipline of information security. Programme Outcome 2: This subject equips the students with the necessary tools for building Information and Communications Technology (ITC) models. 				
Subject Synopsis/ Indicative Syllabus	Syllabus:				
	 <u>Number Theory</u> This part aims to cover elementary number theory. Topics include modular exponentiation, Euclidean algorithms, modular arithmetic, multiplicative inverses, system of linear congruences, discrete logarithms, and error correcting codes. Combinatorics 				
	This part covers combinatorial probability, Knapsack problem, and pigeonhole principle, and binomial coefficients. Optional overview of advanced topics such as linear programming and game theory, network and graph theory.				
	3. <u>Statistics</u> This part covers methods of collecting and summarising data. Statistical inference methods concerning population means, proportions and variances are given. Common statistical tests and procedures, including correlation, regression analysis, Chi-square test will be covered.				
	4. <u>RSA encryption</u> Applications of the above mathematical concepts to the area of information security will be discussed (e.g. RSA and ElGamal encryption based on number theory, virus signature detection using statistical test).				

Teaching/Learning Methodology	During the lectures, students will come across the common concepts and theories. Those concepts and theories would be explained with reference to sample applications.							
	In the tutorials, students will be given scenarios related to the area of information security where these mathematical concepts are relevant.							
Assessment Methods in Alignment with Intended Subject	Specific Assessment Methods/Tasks	% Weighting	Intended Subject Learning Outcomes to be Assessed (Please tick as appropriate)					
Learning Outcomes			1	2	3	4		
	1. Continuous Assessment	50%	~	~	~	~		
	2. Examination	50%	~	~	\checkmark	~		
	Total	100%						
	Types of assessments include assignments, test and examination. Assignments are designed to reinforce the concepts and theories learned in the lecture and tutorial, by solving bigger problems. Test and examination are used to assess independent problem solving and critical thinking skills.							
Student Study Effort	rt Class contact:							
	Lecture Tutorial / Lab							
	Other student study effort:							
	 Assignments, project, 	gnments, project, self-study, text and exam preparation				66 Hours		
	Total student study effort:
