Motivations

Finding sparse solutions of linear systems:

$$\begin{array}{ll} \min_x & \|x\|_0 \\ \text{s.t.} & Ax = b. \end{array}$$

Motivations

Finding sparse solutions of linear systems:

$$\begin{aligned} \min_x \quad & \|x\|_0 \\ \text{s.t.} \quad & Ax = b. \end{aligned}$$

Approximation models: $\min_{Ax=b} \sum_{i=1}^n \phi(|x_i|)$, or

$$\min_x \frac{1}{2} \|Ax - b\|^2 + \sum_{i=1}^n \phi(|x_i|),$$

where ϕ is a **sparsity inducing function**, such as:

- ℓ_1 penalty: $\phi(|t|) = \lambda|t|$ (Tibshirani '96);
- log penalty: $\phi(|t|) = \lambda \log(1 + |t|/\epsilon)$ (Candès et al. '08);
- smoothly clipped absolute deviation ($\alpha > 2$):
 $\phi(|t|) = \int_0^{|t|} \min \left\{ 1, \frac{(\alpha-s/\lambda)_+}{\alpha-1} \right\} ds$ (Fan, Li '01).

Iteratively reweighted ℓ_1 algorithms

- IRL₁ algorithms solve $\min_{Ax=b} \sum_{i=1}^n \phi(|x_i|)$ by iteratively solving

$$x^{k+1} \in \text{Arg min}_{Ax=b} \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i|.$$

Iteratively reweighted ℓ_1 algorithms

- IRL₁ algorithms solve $\min_{Ax=b} \sum_{i=1}^n \phi(|x_i|)$ by iteratively solving

$$x^{k+1} \in \text{Arg min}_{Ax=b} \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i|.$$

- Convergence guaranteed under suitable assumptions on ϕ (Candès, Wakin, Boyd '08, Chartrand, Yin '08, etc.).
- A recent variant proposed in Lu '14 minimizes $f(x) + \sum_{i=1}^n \phi(|x_i|)$ for a Lipschitz differentiable f :

$$x^{k+1} = \arg \min_x \left\{ \langle \nabla f(x^k), x \rangle + \frac{L_k}{2} \|x - x^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i| \right\};$$

Iteratively reweighted ℓ_1 algorithms

- IRL₁ algorithms solve $\min_{Ax=b} \sum_{i=1}^n \phi(|x_i|)$ by iteratively solving

$$x^{k+1} \in \operatorname{Arg} \min_{Ax=b} \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i|.$$

- Convergence guaranteed under suitable assumptions on ϕ (Candès, Wakin, Boyd '08, Chartrand, Yin '08, etc.).
- A recent variant proposed in Lu '14 minimizes $f(x) + \sum_{i=1}^n \phi(|x_i|)$ for a Lipschitz differentiable f : $\{L_k\}$ is determined by line-search, for empirical acceleration

$$x^{k+1} = \arg \min_x \left\{ \langle \nabla f(x^k), x \rangle + \frac{L_k}{2} \|x - x^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i| \right\};$$

Iteratively reweighted ℓ_1 algorithms

- IRL₁ algorithms solve $\min_{Ax=b} \sum_{i=1}^n \phi(|x_i|)$ by iteratively solving

$$x^{k+1} \in \operatorname{Arg} \min_{Ax=b} \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i|.$$

- Convergence guaranteed under suitable assumptions on ϕ (Candès, Wakin, Boyd '08, Chartrand, Yin '08, etc.).
- A recent variant proposed in Lu '14 minimizes $f(x) + \sum_{i=1}^n \phi(|x_i|)$ for a Lipschitz differentiable f : $\{L_k\}$ is determined by line-search, for empirical acceleration

$$x^{k+1} = \arg \min_x \left\{ \left\langle \nabla f(x^k), x \right\rangle + \frac{L_k}{2} \|x - x^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i| \right\};$$

- Alternative strategies for empirical acceleration?

Extrapolation

- A classical technique for acceleration. Dating back to Polyak's heavy ball method (Polyak '64).

Extrapolation

- A classical technique for acceleration. Dating back to Polyak's heavy ball method (Polyak '64).
- Nesterov's extrapolation techniques (Nesterov '83) led to “optimal” 1st-order methods for minimizing $f + P$, where f is convex Lipschitz differentiable and P is proper closed convex. Some representative algorithms are:
 - ★ FISTA (Beck, Teboulle '09, Nesterov '13);
 - ★ the method in Auslender, Teboulle '06;
 - ★ the method in Lan, Lu, Monteiro '11.

Extrapolation

- A classical technique for acceleration. Dating back to Polyak's heavy ball method (Polyak '64).
- Nesterov's extrapolation techniques (Nesterov '83) led to “optimal” 1st-order methods for minimizing $f + P$, where f is convex Lipschitz differentiable and P is proper closed convex. Some representative algorithms are:
 - ★ FISTA (Beck, Teboulle '09, Nesterov '13);
 - ★ the method in Auslender, Teboulle '06;
 - ★ the method in Lan, Lu, Monteiro '11.
- Extrapolation techniques have been applied to 1st-order methods for some nonconvex problems (Ghadimi, Lan '16, Drusvyatskiy, Paquette '16, Wen, Chen, Pong '17), with good empirical performance.

Aim

Our target:

- Explore how **widely used extrapolation techniques** can be incorporated to (empirically) accelerate IRL₁ algorithms.
- Analyze convergence of the resulting algorithms: find **explicit conditions** on the extrapolation parameters for convergence.

Problem setting

$$\min_x F(x) := f(x) + \delta_C(x) + \Phi(|x|).$$

We assume

- f is convex differentiable, ∇f is Lipschitz with modulus $L > 0$;
- C is a nonempty closed convex set;
- $\Phi(y) = \sum_{i=1}^n \phi(y_i)$, where $\phi : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ satisfies the following properties:
 - ★ ϕ is continuous and concave in \mathbb{R}_+ , and is differentiable on $(0, \infty)$;
 - ★ $\phi(0) = 0$ and $\lim_{t \downarrow 0} \phi'(t)$ exists (which imply $\phi'_+(0)$ exists).

Problem setting

$$\min_x F(x) := f(x) + \delta_C(x) + \Phi(|x|).$$

We assume

- f is convex differentiable, ∇f is Lipschitz with modulus $L > 0$;
- C is a nonempty closed convex set;
- $\Phi(y) = \sum_{i=1}^n \phi(y_i)$, where $\phi : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ satisfies the following properties:
 - ★ ϕ is continuous and concave in \mathbb{R}_+ , and is differentiable on $(0, \infty)$;
 - ★ $\phi(0) = 0$ and $\lim_{t \downarrow 0} \phi'(t)$ exists (which imply $\phi'_+(0)$ exists).
- F is level-bounded.

IRL₁e₁: Algorithmic framework

Algorithm 1: IRL₁e₁

Step 0. Input $x^0 = x^{-1} \in \mathcal{C}$, $\{\beta_k\} \subset [0, 1)$. Set $k = 0$.

Step 1. Set

$$y^k = x^k + \beta_k(x^k - x^{k-1});$$

$$x^{k+1} = \arg \min_{y \in \mathcal{C}} \left\{ \langle \nabla f(y^k), y \rangle + \frac{L}{2} \|y - y^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|) |y_i| \right\}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

IRL₁e₁: Algorithmic framework

Algorithm 1: IRL₁e₁

Step 0. Input $x^0 = x^{-1} \in \mathcal{C}$, $\{\beta_k\} \subset [0, 1)$. Set $k = 0$.

Step 1. Set

$$y^k = x^k + \beta_k(x^k - x^{k-1});$$

$$x^{k+1} = \arg \min_{y \in \mathcal{C}} \left\{ \langle \nabla f(y^k), y \rangle + \frac{L}{2} \|y - y^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|) |y_i| \right\}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

- Reduces to FISTA (Beck, Teboulle '09, Nesterov '13) when $\Phi \equiv 0$ and $\{\beta_k\}$ is chosen properly.

IRL₁e₁: Convergence analysis

Makes extensive use of

$$H_1(x, y) := F(x) + \frac{L}{2}\|x - y\|^2.$$

IRL₁ e₁: Convergence analysis

Makes extensive use of

$$H_1(x, y) := F(x) + \frac{L}{2} \|x - y\|^2.$$

Theorem 1. (Yu, P. '17)

Suppose that $\sup \beta_k < 1$. Let $\{x^k\}$ be generated by IRL₁ e₁. Then

- $\{H_1(x^k, x^{k-1})\}$ is nonincreasing.
- The sequence $\{x^k\}$ is bounded and any accumulation point is a stationary point of F .
- If H_1 is a Kurdyka-Łojasiewicz function and ϕ'_+ is globally Lipschitz in \mathbb{R}_+ , then $\{x^k\}$ is convergent.

Recall that x^* is a stationary point of F if $0 \in \partial F(x^*)$.

IRL₁e₂: Algorithmic framework

Algorithm 2: IRL₁e₂

Step 0. Input $x^0, z^0 \in C, \{\theta_k\} \subset (0, 1]$. Set $k = 0$.

Step 1. Set

$$y^k = (1 - \theta_k)x^k + \theta_k z^k;$$

$$z^{k+1} = \arg \min_{x \in C} \left\{ \langle \nabla f(y^k), x \rangle + \frac{L\theta_k}{2} \|x - z^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i| \right\};$$

$$x^{k+1} = (1 - \theta_k)x^k + \theta_k z^{k+1}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

IRL₁e₂: Algorithmic framework

Algorithm 2: IRL₁e₂

Step 0. Input $x^0, z^0 \in C$, $\{\theta_k\} \subset (0, 1]$. Set $k = 0$.

Step 1. Set

$$y^k = (1 - \theta_k)x^k + \theta_k z^k;$$

$$z^{k+1} = \arg \min_{x \in C} \left\{ \langle \nabla f(y^k), x \rangle + \frac{L\theta_k}{2} \|x - z^k\|^2 + \sum_{i=1}^n \phi'_+(|x_i^k|)|x_i| \right\};$$

$$x^{k+1} = (1 - \theta_k)x^k + \theta_k z^{k+1}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

- Reduces to the fast 1st-order method in [Auslender, Teboulle '06](#) when $\Phi \equiv 0$ and $\{\theta_k\}$ is chosen properly.

IRL₁ e₂: Convergence analysis

Also makes extensive use of

$$H_1(x, y) = F(x) + \frac{L}{2} \|x - y\|^2.$$

IRL₁e₂: Convergence analysis

Also makes extensive use of

$$H_1(x, y) = F(x) + \frac{L}{2}\|x - y\|^2.$$

Theorem 2. (Yu, P. '17)

Suppose that $\{\theta_k\}$ is chosen so that

$$\sup_k \{\theta_k^2(1 - \theta_{k-1})^2 - \theta_{k-1}^2\} < 0,$$

and let $\{x^k\}$ be generated by IRL₁e₂. Then

- $\{H_1(x^k, x^{k-1})\}$ is nonincreasing.
- The sequence $\{x^k\}$ is bounded and any accumulation point is a stationary point of F .

IRL₁e₃: Algorithmic framework

Algorithm 3: IRL₁e₃

Step 0. Input $x^0, z^0 \in C$, $\{\theta_k\} \subset (0, 1]$. Set $k = 0$.

Step 1. Set

$$y^k = (1 - \theta_k)x^k + \theta_k z^k;$$

$$z^{k+1} = \arg \min_{x \in C} \left\{ \langle \nabla f(y^k), x \rangle + \frac{L\theta_k}{2} \|x - z^k\|^2 + \sum_{i=1}^n \phi'(|x_i^k|)|x_i| \right\};$$

$$x^{k+1} = \arg \min_{y \in C} \left\{ \langle \nabla f(y^k), y \rangle + \frac{L}{2} \|y - y^k\|^2 + \sum_{i=1}^n \phi'(|x_i^k|)|y_i| \right\}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

IRL₁ e₃: Algorithmic framework

Algorithm 3: IRL₁ e₃

Step 0. Input $x^0, z^0 \in C$, $\{\theta_k\} \subset (0, 1]$. Set $k = 0$.

Step 1. Set

$$y^k = (1 - \theta_k)x^k + \theta_k z^k;$$

$$z^{k+1} = \arg \min_{x \in C} \left\{ \langle \nabla f(y^k), x \rangle + \frac{L\theta_k}{2} \|x - z^k\|^2 + \sum_{i=1}^n \phi'(|x_i^k|) |x_i| \right\};$$

$$x^{k+1} = \arg \min_{y \in C} \left\{ \langle \nabla f(y^k), y \rangle + \frac{L}{2} \|y - y^k\|^2 + \sum_{i=1}^n \phi'(|x_i^k|) |y_i| \right\}.$$

Step 2. If a termination criterion isn't met, set $k = k + 1$; go to Step 1.

- Reduces to the fast 1st-order method in [Lan, Lu, Monteiro '11](#) when $\Phi \equiv 0$ and $\{\theta_k\}$ is suitably chosen.

IRL₁ e₃: Convergence analysis

Makes extensive use of

$$H_3(x, y, w) = F(x) + \frac{L}{2} \|w - x\|^2 + \frac{L}{2} \|w - y\|^2.$$

IRL₁e₃: Convergence analysis

Makes extensive use of

$$H_3(x, y, w) = F(x) + \frac{L}{2}\|w - x\|^2 + \frac{L}{2}\|w - y\|^2.$$

Theorem 3. (Yu, P. '17)

Suppose that $\{\theta_k\}$ is chosen so that for some $\gamma \in (0, 1)$,

$$\sup_k \max \left\{ \frac{\theta_k^2(1 - \theta_{k-1})^2}{\gamma} - \theta_{k-1}^2, \frac{\theta_k^2}{1 - \gamma} - 1 \right\} < 0.$$

Let $\{x^k\}$ be generated by IRL₁e₃. Then

- The sequence $\{x^k\}$ is bounded and any accumulation point is a stationary point of F .
- If H_3 is a Kurdyka-Łojasiewicz function and ϕ'_+ is globally Lipschitz in \mathbb{R}_+ , then $\{x^k\}$ is convergent.

Numerical simulations

- Solve

$$\min_x \frac{1}{2} \|Ax - b\|^2 + \lambda \sum_{i=1}^n \log(1 + |x_i|/\epsilon).$$

- Consider random instances: generate an $m \times n$ matrix A , an r -sparse vector \tilde{x} , a noise vector \hat{n} and set $b = A\tilde{x} + \hat{n}$.
- Compare $\text{IRL}_1 e_1$ and $\text{IRL}_1 e_3$ with NPG (Wright et al. '09).
- Initialize at $x^0 = 0$.
- Terminate when $\text{dist}(0, \partial F(x^k)) \leq 10^{-4} \max\{1, \|x^k\|\}$.

Numerical simulations

- Solve

$$\min_x \frac{1}{2} \|Ax - b\|^2 + \lambda \sum_{i=1}^n \log(1 + |x_i|/\epsilon).$$

- Consider random instances: generate an $m \times n$ matrix A , an r -sparse vector \tilde{x} , a noise vector \hat{n} and set $b = A\tilde{x} + \hat{n}$.
- Compare $\text{IRL}_1 e_1$ and $\text{IRL}_1 e_3$ with NPG (Wright et al. '09).
- Initialize at $x^0 = 0$.
- Terminate when $\text{dist}(0, \partial F(x^k)) \leq 10^{-4} \max\{1, \|x^k\|\}$.
- For $\text{IRL}_1 e_1$: $\{\beta_k\}$ chosen as in FISTA with fixed and adaptive restart.
For $\text{IRL}_1 e_3$: $\{\theta_k\}$ chosen similarly as in Lan, Lu, Monteiro '11 initially, and then set to be constant after 50 iterations.

Numerical simulations

Choose $\lambda = 5 \times 10^{-4}$ and $\epsilon = 0.5$. The t_0 is the time for computing $\lambda_{\max}(A^T A)$. Averaged over 20 instances.¹

Conclusion

- Commonly used extrapolation techniques for convex composite optimization can be suitably incorporated into IRL₁ algorithms.
- Explicit conditions on the extrapolation parameters are given to guarantee convergence of the resulting algorithms.
