Language Vitality: Understudied in Evolutionary Linguistics

Evolutionary linguistics is not just about the evolution of structures, it is also about *language vitality*, an umbrella term about language birth, vibrance, resilience, endangerment, and death. It conjures up population movements and language contact within specific population structures, with the latter rolling the dice not only on how forms and structures are selected from a joint feature pool into and out of new language varieties but also on which languages prevail, remain vibrant or resilient, or vanish in particular social ecologies.

In the face of linguistic diversity, we probably will never know how many languages were spoken among humans by the time of the Exodus out of Africa. On the other hand, the known history of human migrations, including imperial/colonial expansions, has made obvious that language birth and death have occurred repeatedly. This history makes it imperative for us to investigate the ecological conditions under which these processes have occurred and to assess the current claim that the number of languages has been dramatically decreasing compared to earlier stages of human history.

Thinking of languages as technologies can we explain why some populations give up their languages and whether users or the situations leading them to such shifts should be blamed or pitied for doing so? Is language shift maladaptive? Is it different from other kinds of technology shifts, including religion, health practices, diets, and clothing, among a host of other folk technologies?

Salikoko S. MUFWENE is the Edward Carson Waller Distinguished Service Professor of Linguistics and the College at the University of Chicago, where he also serves as Professor in the Department of Race, Diaspora, and Indigeneity. He has additional appointments to the Committee of Evolutionary Biology, the Committee on Conceptual and Historical Studies of Science, and the Committee on African Studies. His current research is in

evolutionary linguistics, which he approaches from an ecological perspective, focused on the phylogenetic emergence of languages and language speciation, especially the emergence of creoles and other forms of the indigenization of European languages in the colonies, as well as language vitality. He has also published papers on grammaticalization in creoles. His books include: *The Ecology of Language Evolution* (CUP, 2001), *Language Evolution: Contact, competition and change* (Continuum Press, 2008), *Iberian Imperialism and Language Evolution in Latin America* (ed., U of Chicago Press, 2014), *Bridging Linguistics and Economics* (ed., with Cécile B. Vigouroux, CUP, 2020), and two volumes of *The Cambridge Handbook of Language Contact* (ed., with Anna María Escobar, 2022). He is the founding editor of Cambridge Approaches to Language Contact and co-editor (with Cécile B. Vigorous) of new series Cambridge Elements in Language Contact. He also a fellow of both the Linguistic Society of America (since Jan. 2018) and the American Philosophical Society (since May 2022). <https://linguistics.uchicago.edu/salikoko-s-mufwene/>
