This Document is subject to review and changes which the programme offering Faculty/Department can decide to make from time to time. Students will be informed of the changes as and when appropriate. This Document should be read together with the Regulations and Administrative Procedures for the Degrees of MPhil and PhD and the Research Student Handbook.

# Part I General

#### 1. Introduction

The Faculty of Construction and Environment (FCE), to achieve its mission "to meet the needs of infrastructure development and environmental conservation in Hong Kong, the Chinese mainland and beyond", offers a broad range of internationally competitive academic programmes and conducts world-class high-impact interdisciplinary research in construction, environment, energy, urban hazard mitigation, urban informatics towards sustainable urban development and smart city.

FCE provides numerous programmes for studies leading to the Doctor of Philosophy (PhD) or Master of Philosophy (MPhil) degrees. Research students are nurtured to become scholars, researchers, and entrepreneurs who can *demonstrate research and scholarship excellence*, *conduct independent and original research*, and *engage in lifelong learning*.

Our Research Postgraduate (RPg) Programmes are designed to facilitate the competence development in research methods and scholarship. Students are encouraged to display sustained effort and independent original thought for high-impact interdisciplinary research. The Faculty also strives to develop entrepreneurial competencies in students by promoting the exchange of inventive ideas and entrepreneurial experiences.

MPhil and PhD students are required to satisfactorily investigate or evaluate a chosen area, to show understanding of the context and significance of the work, and to present a compelling thesis worthy of publication. Furthermore, PhD students are expected to produce evidence and arguments to support an original proposition that represents a significant contribution to knowledge.

The degree of PhD or MPhil shall be awarded to a student who, on completion of an approved programme and fulfilling the coursework requirements for graduation, presents a thesis embodying the results of his/her research and satisfies the examiners in an oral examination (and other examinations if required) in matters relevant to the subject of the thesis.

#### 2. Educational Aims and Institutional Learning Outcomes

Built on the strength of its research in sustainable urban development, the Faculty's diversified postgraduate programmes aim to make the world a better place by engaging in multidisciplinary research. On completion of their postgraduate degrees, students are expected to be able to demonstrate research and scholarship excellence, originality, and lifelong learning capability.

#### 2.1. Research and Scholarship Excellence

MPhil graduates of PolyU should demonstrate advanced competence in research methods, with the ability to apply their knowledge to analyze and solve identified issues and problems in their areas of study. They should also be able to disseminate/communicate effectively their research findings in publications, conferences and classrooms.

PhD graduates of PolyU should demonstrate state-of-the-art expertise and knowledge in their areas of study, possess superior competence in research methodologies and contribute as leaders in creating new knowledge through analysis, diagnosis and synthesis. They should also be able to disseminate/communicate their research ideas and findings effectively and efficiently in publications, conferences and classrooms.

#### 2.2. Originality

MPhil graduates of PolyU will be versatile problem solvers with good mastery of critical and creative thinking methodologies. They can generate practical and innovative solutions to problems in their areas of study.

PhD graduates of PolyU will be able to think out of the box. They will be innovative problem solvers with excellent mastery of critical and creative thinking methodologies. They will create new original solutions to issues and problems pertaining to their areas of expertise and the society in general.

#### 2.3. Lifelong Learning Capability

MPhil graduates of PolyU will have an enhanced capability for continual professional development through inquiry and reflection on knowledge in their areas of study.

PhD graduates of PolyU will demonstrate the ability to engage in an enduring quest for knowledge and an enhanced capability for continual academic/professional development through selfdirected research in their areas of study.

#### 3. Mode of Study and Duration

#### 3.1. Academic Year

There are two teaching semesters, each of 13 weeks, and a 7-week summer term. The academic year starts in early September, with the second semester ending sometime in April and the summer term running from May to July.

#### 3.2. Mode of Study and Duration

The following table shows the normal and maximum periods of study for various research degree programmes. Students enrolled for joint PhD programmes leading to dual awards please refer to Section 9 for details.

| Degree | Study Mode | Normal Study Period | Maximum Study Period |
|--------|------------|---------------------|----------------------|
| PhD    | Full-time  | 3 years#            | 5 years              |
|        |            | 4 years             | 6 years              |
|        | Part-time  | 6 years#            | 7 years              |
|        |            | 8 years             | 9 years              |
| MPhil  | Full-time  | 2 years             | 3 years              |
|        | Part-time  | 4 years             | 5 years              |

<sup>#</sup> The normal period of study for these PhD students is based on the possession of a Master's degree with a significant research component, such as a dissertation, as determined by the Departmental Research Committee (DRC).

If a student is unable to complete his/her study within the normal study period, he/she shall notify the DRC Chair via the Chief Supervisor in writing before the normal study period expires, indicating the reasons and the expected completion date, which should fall within the maximum study period. The DRC Chair shall act on the Chief Supervisor's recommendations to approve or disapprove the student's request for continuing his/her study beyond the normal study period (but within the maximum study period).

#### 4. Admission

#### 4.1. Admission Requirements

To register for the degree of MPhil, a student must hold:

- A Bachelor's degree with first or second class honours from a recognised university; OR
- Other academic qualifications which are deemed to be equivalent.

To register for the degree of PhD, a student must normally hold a postgraduate degree containing a significant research component, such as a dissertation, conferred by a recognised university.

In exceptional circumstances, applicants other than those stipulated above may be admitted directly to the PhD programme. For example, applicants with a Bachelor's degree with first class honours, or the equivalent. Such applicants may be required to pass an examination.

PolyU may accept other equivalent qualifications. The decision is made on an individual basis.

#### 4.2. English Language Requirements

The requirements for those who do not have a degree for which English was the language of instruction at a recognised university are:

- An overall score of at least 6.5 in the International English Language Testing System (IELTS); OR
- A Test of English as a Foreign Language (TOEFL) score of 80 or above for the Internet- based test or 550 or above for the paper-based test.

All English language test scores are considered valid for five years after the date of the test.

#### 4.3. Research Proposal & Supervisory Arrangements

A student registered for the degree of MPhil or PhD shall follow an approved programme of research and coursework under a Chief Supervisor and, if appropriate, Co-supervisors. With a view to providing both departments and newly-admitted research students opportunities to identify the most appropriate supervisors, there are two supervisory arrangements:

- The DRC assigns a Chief Supervisor and approves a student's detailed research proposal before the commencement of study.
- If the student is admitted without being assigned a Chief Supervisor and without an approved research project at the point of admission, i.e., on the first day of affiliation with the department, the department is obliged to assign the most suitable staff member(s)

as supervisor(s) within four months of admission. The student and his/her supervisor(s) are required to formulate a research proposal for the DRC's approval within four months of admission.

Please refer to the *Research Student Handbook* from the Graduate School (GS) for a clear statement of the roles and responsibilities of the various parties involved in research supervision. [1]

#### 4.4. Application Procedures

The main application deadline for PolyU research postgraduate programmes is <u>31 December</u> each year. Applicants should submit an online application and settle the application fee before the application deadline via our eAdmission System.

The Hong Kong PhD Fellowship Scheme (HKPFS), established by the Hong Kong Research Grants Council (RGC), calls for applications <u>around September</u> each year. To apply for HKPFS via PolyU, applicants should file an initial application to the RGC via the HKPFS Electronic System to obtain a reference number. Applicants must quote the HKPFS reference number allocated by the RGC in their applications to PolyU.

Applicants may log-in to our eAdmission System to check their application status (e.g., notification of interview/test and admission offer).

Please refer to "Importance Notes to Applicants" under "e-prospectus" for Research Postgraduate for detailed application information and procedures. [2]

#### 5. <u>Registration and Progress</u>

Students have to commence their study at the start of Semester 1, Semester 2 or Summer Semester.

#### 5.1. Confirmation of Registration

A successful applicant is provisionally registered as a full-time or part-time research degree student.

Within the first half of the normal period of study, a research student is required to have his/her registration confirmed, subject to a formal assessment. If the progress of the research study is satisfactory, the student's registration in the PhD or MPhil programme is confirmed.

Registered MPhil students can apply for transfer to PhD programmes during the process. Students who fail to complete their confirmation of registration within the first half of their normal period of study will be considered as not progressing satisfactorily, and may be de- registered from their study. [1]

#### 5.2. Progress Monitoring

A student should ensure there is a clear understanding of the communication mechanisms and the frequency of research guidance meetings with the supervisor (usually meetings are more frequent at the start and near completion of the research programme).

All students will be assessed by their academic department by the end of each Semester. DRC is required to indicate in the Student Record System if an RPg student will be allowed to proceed on with their study by end of each Semester. [1]

#### 5.3. Deregistration

A student may be deregistered in the following circumstances:

- if his/her progress is considered unsatisfactory; or
- if the maximum period of study is exceeded; or
- if his/her thesis is deemed unsatisfactory.

A recommendation for deregistration as a result of unsatisfactory progress may be proposed by the Chief Supervisor and approved by the DRC.

A recommendation for deregistration as a result of unsatisfactory thesis made by the Board of Examiners (BoE) shall be approved or rejected by the Graduate School Board.

#### 6. Requirements of Graduation

Students should meet the following requirements before they can be considered for graduation:

#### 6.1. English Enhancement Subjects and Research Language Skills Assessment

For research students admitted in the 2017/18 cohort or before who have not yet taken and passed the English enhancement subjects, they shall approach the Graduate School (GS) for advice and subject enrolment.

With effect from 2018/19 cohort onwards, all RPg students are required to take and pass two English enhancement subjects, before thesis submission:

- ELC6001 "Presentation Skills for Research Students" and
- ELC6002 "Thesis Writing for Research Students".

For exemption, RPg students need to pass the Research Language Skills Assessment (RLSA).

#### 6.2. Coursework/Credit Requirements

#### 6.2.1. University Coursework Requirements

Students are required to complete the coursework/credit requirements before thesis submission. Subjects are chosen by the student, with advice from the Chief Supervisor. The University coursework/credit requirements are:

| Programme               | Coursework<br>requirement | Details   |
|-------------------------|---------------------------|---|
| 2-year full-time/       | 9 credits                 | - 1 credit from HTI6081*                              |
| 4-vear nart-time MPhil  |                           | - 2 credits from attending seminars                   |
| + year part time within |                           | - 6 credits from Faculty compulsory                   |
|                         |                           | subjects  |
| 3-year full-time/       | 15 credits                | - 1 credit from HTI6081*                              |
| 6-vear nart-time PhD    |                           | <ul> <li>3 credits from attending seminars</li> </ul> |
|                         |                           | - 2 credits from Practicum                            |
|                         |                           | - 9 credits from Faculty compulsory                   |
|                         |                           | and other elective subjects                           |
| 4-year full time/       | 22 credits                | - 1 credit from HTI6081*                              |
| 8-vear part-time PhD    |                           | <ul> <li>4 credits from attending seminars</li> </ul> |
|                         |                           | - 2 credits from Practicum                            |
|                         |                           | - 15 credits from Faculty compulsory                  |
|                         |                           | and other elective subjects                           |

\*HTI6081 is a University compulsory 1-credit subject entitled "Ethics: Research, Professional and Personal Perspectives".

#### 6.2.2. Faculty Compulsory and Elective Subjects

Research students of FCE are required to complete the Faculty compulsory subjects listed below before thesis submission:

- CE603 Research Frontiers in Construction and Environment (3 credits)
- CE620 Research Methods (3 credits)

Subject to the advice and approval of the Chief Supervisor, students may enroll in subjects offered by the Faculty, by its own departments, by sister departments of PolyU and/or by other universities in Hong Kong, in order to fulfill the credit requirements.

All FCE guided-study subjects were removed *en bloc* from the programme curricula from 2018/19 academic year.

#### 6.2.3. Practicum

All PhD students, irrespective of funding source and mode of study, must complete two training credits before thesis submission. To earn one credit for practicum, students will be required to engage in teaching/research supporting activities assigned by the Head of Department (HoD) or his/her delegate for 6 hours/week in any 13-week semester before thesis submission.

Students who are required to undertake teaching supporting activities are required to complete the training programmes organized by the Educational Development Centre, English Language Centre/Chinese Language Centre (as required) before the commencement of any teaching supporting activities.

#### 6.2.4. Attendance at Seminars

Full-time students are required to attend at least 10 research seminars per year for one credit, in addition to workshops/conferences, and to submit a report, to the Chief Supervisor, of no less than 1,500 words (excluding references) on one of the attended seminars every year.

Part-time students are required to attend at least 10 research seminars per two years for one credit, in addition to workshops/conferences, and to submit a report, to the Chief Supervisor, of no less than 1,500 words (excluding references) on one of the attended seminars once every two years.

Students are recommended to complete one credit per year (for full-time students) or per two years (for part-time students) to fulfill the above-mentioned requirement, with an overall assessment grade of Pass and Fail. However, as deemed appropriate by the Chief Supervisor, they are allowed to complete at most two credits per year (for full-time students) or per two years (for part-time students) to fulfill the research seminar credit requirement.

Please refer to Research Students Handbook for the detailed requirements. [1]

#### 6.2.5. Credit Transfer

Applications for the transfer of credits from recognised previous studies at postgraduate level will be endorsed by the DRC with justifications and approved by the HoD. The validity period for such credit transfer for research degree programmes is defined to be five years from the year of attainment at the time of admission. Only credits gained from subjects at postgraduate level that have not been used to contribute to an award will be acceptable for transfer.

#### 6.2.6. Subject Exemption

A student may be exempted from taking a compulsory subject if he/she has successfully completed a similar subject previously in another programme or has already acquired the associated knowledge and skills via work experience, etc. Subject exemption is decided by the DRC, although students can also apply for it. If a student is exempted from taking a compulsory subject, the credits associated with the subject will not count towards the credit requirements. It will therefore be necessary for the student to take another subject, approved by the Chief Supervisor, to satisfy the credit requirements.

For regulations and procedures governing the credit transfer and subject exemption, please refer to the *Research Student Handbook*. [1]

#### 6.2.7. Qualifying GPA Requirements

Research students need to fulfill their coursework/credit requirements with a stipulated qualifying GPA before they can submit the thesis for examination.

#### 6.3. Residence Requirement

Residence provides students with an opportunity to become immersed in the intellectual environment of the University. Residence also includes periods during which students' research requires off-campus field work or non-PolyU laboratory work. Despite of the mode of study, the residence requirement for an MPhil degree is two regular semesters; and that for a PhD degree is three regular semesters if a relevant research Master's degree is earned prior to entering the programme, but four regular semesters if it is not. All research postgraduate students must fulfill the residence requirement before thesis submission. [1]

In addition to the residence requirement, full-time research postgraduate students are required to be on campus full-time and consequently in such geographical proximity as to be able to participate fully in University activities associated with the programme.

Where a student needs to conduct his/her research outside Hong Kong, adequate supervision arrangements must be proposed by the Chief Supervisor and approved by the DRC for study periods spent outside Hong Kong.

#### 6.4. Thesis Requirements

On completion of an approved programme of study and research, students must submit a thesis before the end of their maximum period of study and defend it in an oral examination. If a student is unable to complete his/her study within the normal period, he/she shall notify the DRC via the Chief Supervisor in writing before the normal period expires, indicating the expected completion date and the reasons for failing to submit the thesis within the normal period. Any research student who fails to submit his/her thesis by the end of the normal period of study is required to pay a continuation fee.

Research students of FCE need to complete their coursework with a stipulated qualifying GPA, before they can submit the thesis for examination.

MPhil and PhD theses shall consist of the student's own account of his/her investigations and be an integrated and coherent piece of work. The thesis shall be presented in English. An intention to present the thesis in a language other than English will be considered, preferably on admission. Strong justifications on academic grounds must be provided to substantiate that the use of English will adversely affect the clarity of the thesis should another language be used. [1]

#### 7. Award of Degree

The PhD or MPhil degree is awarded to a student who completes all stipulated coursework requirements, presents a thesis embodying the results of their research and satisfies the examiners in an oral examination (and other examinations if required) in matters relevant to the subject of the thesis.

#### 8. Financial Assistantship

#### 8.1. Hong Kong PhD Fellowship Scheme (HKPFS)

The Scheme, established by the Hong Kong Research Grants Council (RGC), aims to attract the best and brightest students in the world to pursue their PhD programmes in Hong Kong. The Scheme calls for applications in September each year. [3]

#### 8.2. Studentship

The Studentship is a scholarship for full-time research students intended to be a means of financial support to allow them to fully focus on their studies. It shall be awarded on the basis of academic merit. A Studentship awardee will receive a stipend from the University on a monthly basis. Since the awardee is a full-time student and not an employee of the University, the award will not be subject to taxation.

The duration of the studentship is normally an academic year within the normal study period of a student. The provision of the Studentship is not guaranteed and is also subject to the awardee making satisfactory progress in his/her study and availability of funding.

#### 8.3. Assistantship under the Teaching Postgraduate Studentship (TPS) Scheme

The main purpose of the Assistantship for Research Postgraduate (RPg) students under the Teaching Postgraduate Studentship (TPS) Scheme is twofold:

- to grant, on a merit basis, financial support to eligible full-time RPg students with a view to allowing them to fully focus on their studies; and
- to provide more teaching experience and training opportunity to interested RPg students in order to widen their exposure for the development of their academic career.

Only full-time RPg students who are not receiving a stipend will be eligible for receiving assistantship under TPS. Selected students for an assistantship under the TPS will be appointed as part- time Teaching Assistants (TA) at the University on terms and conditions in accordance with the University's policies on part-time appointment.

#### 8.4. Scholarships

#### The Hong Kong Polytechnic University International Postgraduate Scholarships for PhD Studies

The Scholarships will be awarded to academically strong applicants who can contribute to the internationalisation of the PolyU and bring cultural diversity to the University through open competition. Subject to satisfactory progress in students' studies, the scholarship will cover the cost of tuition during the study period.

#### 8.5. Associated Money and Conference Attendance Grant

All RPg students, irrespective of the funding source, will be provided with Associated Money during the normal study period (with a reference amount of HK\$20,000/year for full-time students and HK\$10,000/year for part-time students).

A maximum amount of Conference Attendance Grant of HK\$20,000 may be granted for each application. There is no restriction on the number of times a student can be supported for conference attendance, as long as the total amount allocated to the student throughout his/her studies does not exceed HK\$25,000.

#### 9. Joint PhD Programmes Leading to Dual Awards

The Programme refers to the joint offer of a PhD programme between PolyU and another institution of good standing. Upon satisfactory completion of study, the student will receive two award parchments issued respectively by PolyU and the partner institution.

Students admitted under these programmes should refer to the *"Framework/Regulations for the Joint PhD Programmes Leading to Dual Awards"* for specific regulations and administrative procedures. [1]

#### 9.1. Admission

<u>Incoming students</u> admitted should satisfy PolyU's minimum entrance requirements and English proficiency requirement. When applying for admission, the applicant must attach a research proposal and a study plan detailing the periods of study at PolyU and the partner institution. The research proposal and the study plan must be approved by both institutions.

<u>Outgoing students</u> of any disciplines are eligible for application. Normally, all full-time PhD students within the first half of the normal study period can apply. However, different partner universities may stipulate different requirements on the remaining time of the normal study period. These institution-specific requirements will be stated in the call for applications.

#### 9.2. Period of Study and Residence Requirements

<u>Incoming students</u> are required to commence their study at PolyU at the start of either Semester 1 or Semester 2. They should follow the normal/maximum study period of regular RPg programmes offered by PolyU. They will base their studies at PolyU for a certain period (in terms of Semester), usually 3 consecutive semesters plus 1 summer term.

<u>Outgoing students</u> will base their studies at the partner institution for a certain period (in terms of Semester), subject to the residence requirements of the partner institution.

#### 9.3. Academic Requirements

As a student will receive two parchments, and in the light of different programme requirements imposed by the partner institution on the joint PhD programme, the student is required to satisfy the programme requirements of both PolyU and the partner institution.

Students are required to complete one single piece of research to fulfill the award requirements of both universities and should observe the regulations and guidelines of both universities at all times.

#### 9.3.1. Transfer of credits from Partner Institution

Credits taken at either of the two universities after admission to the joint programme shall be recognised by both universities. For subjects taken at the Partner Institution without a grade, the DRC shall assign an appropriate grade for the approval of the HoD which shall also vet the validity of the credits.

#### 10. Research/Academic Attachment Opportunities

#### 10.1. Research Student Attachment Programme

The Programme provides invaluable research experience and an opportunity for full-time PhD students to add a global dimension to university life. Successful applicants will continue to receive studentship, if applicable, while continuing their research interests in a non-local host institution. Travel expenses and a monthly subsistence allowance will normally be supported.

Applications are also invited from in-coming visiting full-time PhD research students with substantial international exposure and the potential to contribute to the internationalisation of the University. A monthly subsistence allowance will be granted.

The programme may range from a minimum of three months to a maximum of one year. Two calls for applications will be issued each year: September/October and March/April.

# Part II FCE Research Postgraduate Programmes

# Department of Building and Real Estate

#### Department of Building and Real Estate

#### 1. Introduction

Since its foundation in 1937, the Department has become internationally recognised as a leader in providing professional education for the building and real estate industry in the region and beyond. With our dedication to excellence, we have a multi-disciplinary team of faculty members who possess expertise in their respective fields of surveying, engineering, construction health and safety, town planning, building technology, real estate, finance, law and economics. Committed to a variety of quality research projects and consultancies, we are well-known for our research strengths in construction and building technologies. To facilitate knowledge transfer and networking, we actively maintain strong bonds with the industry and our alumni, many of whom are senior staff in government departments leading consultancy practices and private enterprises.

Dedicated to fundamental and high impact research related to sustainable urban development in densely populated cities, the Department has identified three major focuses, namely: Construction Health and Safety, Digital Construction and Sustainable Urban Systems, which embrace the expertise of most of the staff members. Projects with significant societal impacts are encouraged and supported.

#### 2. Aims and Learning Outcomes

The Research Postgraduate Programmes (PhD and MPhil) aim to train and nurture students to become researchers or scholars capable of conducting independent and original research, and producing significant research findings relevant to their chosen field of specialisation. The main objective of the programmes is to equip students with the knowledge, skills and abilities to conduct academic research work with rigour and integrity. To be awarded the degree, students must demonstrate their independent research competence by submitting a thesis and successfully defending it in an oral examination. This is to ensure that students have attained the required standard and are able to:

- critically evaluate the literature and acquire an in-depth understanding of their chosen area of study;
- identify scientific problems worthy of investigation;
- apply solid and appropriate research methods to conduct the investigation;
- carefully and thoroughly analyze the research findings to reach sound conclusions; and present the research findings in a clear and logical manner.

#### 3. PhD/MPhil Programmes

- PhD Programme in Construction and Real Estate Economics
- MPhil Programme in Construction and Real Estate Economics
- PhD Programme in Construction and Real Estate Management
- MPhil Programme in Construction and Real Estate Management
- PhD Programme in Information and Construction Technology
- MPhil Programme in Information and Construction Technology
- PhD Programme in Urban Sustainability Policy
- MPhil Programme in Urban Sustainability Policy

# Department of Building Services Engineering

#### Department of Building Services Engineering

#### 1. Introduction

The Department of Building Services Engineering (BSE) was officially established in December 1981, and has become one of largest BSE departments worldwide. As a leading provider of trained professionals in building services for the unique environment of Hong Kong, research in BSE focuses on the quality of the environment, energy efficiency and the safety and resilience of buildings to effectively address the contemporary concerns and future challenges of urban environments. Its core mission is to devise and improve engineering systems to promote the health and well-being of building occupants by providing sanctuary from the elements and from the extremes of temperature, noise, light, toxins and pathogens at the lowest cost in energy and resources. It offers a range of undergraduate and postgraduate degree programmes serving the needs of local industry at various levels.

The research in the Department is comparable to those in the reputed universities worldwide in the discipline of Building Environment, as evidenced by research output reported by one of international notable ranking organizations. Expertise of BSE academic staff spans a wide range of areas, including various aspects of sustainability; building energy, heating, ventilation and air-conditioning systems; fire and safety engineering; electrical technology; public health; indoor environmental engineering; architectural engineering; computer-aided design and facilities management.

#### 2. Aims and Learning Outcomes

The PhD and MPhil degree programmes aim to provide rigorous training to students who aspire to become researchers or scholars capable of conducting independent and original research, and producing research findings that are relevant and significant to their chosen field of specialisation. The objectives of the programme of study are to equip students with the knowledge, skills and abilities to perform a piece of investigative work of substance with rigour and wit. To be awarded the degree, students must demonstrate their research competence by submitting a thesis and successfully defending it. This is to ensure that students have attained the appropriate/requisite standard and acquired ability to:

- fully understand and critically evaluate the literature related to their chosen area of study;
- identify problems of relevance and significance worthy of investigation;
- formulate the problems into testable pieces amenable to rigorous investigation;
- apply appropriate research methodology to conduct the investigation;
- perform careful and thorough analysis from which valid conclusions are drawn; and
- present the findings in a clear, lucid and cogent manner.

#### 3. PhD/MPhil Programmes

- PhD Programme in Building and Environment
- MPhil Programme in Building and Environment
- PhD Programme in Building Energy
- MPhil Programme in Building Energy
- PhD Programme in Building Safety and Resilience
- MPhil Programme in Building Safety and Resilience
- PhD Programme in Electrical Services
- MPhil Programme in Electrical Services
- PhD Programme in Facility Management
- MPhil Programme in Facility Management

# 4.10.2. Curriculum Map

# Department of **C**ivil and **E**nvironmental **E**ngineering

#### Department of Civil and Environmental Engineering

#### 1. Introduction

The Department of Civil and Environmental Engineering is dedicated to carry out fundamental and application-oriented research to develop scientific, engineering and management solutions that are appropriate to sustain the urban development in densely-populated cities, such as Hong Kong, in Mainland China and other major cities in Asia. We have a strong team of faculties and have achieved an excellent research and publication track record in civil engineering.

The Research Postgraduate Programmes offered by CEE are a combination of coursework and independent research leading to the degree of Master of Philosophy (MPhil) and Doctor of Philosophy (PhD). All of our academic staff are actively engaged in research activities through a range of funding from UGC, RGC, ITF and other sources. The principal research areas in CEE include: Environmental Engineering & Science; Geotechnical Engineering; Coastal & Hydraulic Engineering; Structural Engineering and Construction & Transportation.

#### 2. Aims and Learning Outcomes

The programme of research comprises coursework and thesis and is designed to enable the student to: (1) acquire competence in research methods and scholarship; (2) display sustained independent effort and original thoughts; and (3) to pursue lifelong learning capability for continual professional development. The programmes target to produce academics, researchers or industrial R&D professionals.

The main difference between a MPhil and a PhD degree is that, the MPhil seeks to understand how to stretch the limits of knowledge while the PhD seeks to add to that knowledge by creating more knowledge aside from what is already existent. The degree of Master of Philosophy or Doctor of Philosophy would be awarded to a student who, on completion of an approved programme of study and research, presents a thesis embodying the results of his/her research and satisfies the examiners in an oral examination (and other examinations if required) in matters relevant to the subject of the thesis.

MPhil and PhD students are required to satisfactorily investigate or evaluate a chosen area, to show understanding of the context and significance of the work, and to present a clear, complete thesis of a quality worthy of publication.
#### 3. PhD/MPhil Programmes

- PhD Programme in Coastal and Hydraulic Engineering
- MPhil Programme in Coastal and Hydraulic Engineering
- PhD Programme in Construction and Transportation
- MPhil Programme in Construction and Transportation
- PhD Programme in Environmental Engineering and Science
- MPhil Programme in Environmental Engineering and Science
- PhD Programme in Geotechnical Engineering
- MPhil Programme in Geotechnical Engineering
- PhD Programme in Structural Engineering
- MPhil Programme in Structural Engineering

Department of Land Surveying and Geo-Informatics

#### Department of Land Surveying and Geo-Informatics

#### 1. Introduction

Established in 1984, the Department of Land Surveying and Geo-Informatics (LSGI) is the only academic unit amongst the local tertiary institutions offering a range of opportunities for education, training and research in the fields of Land Surveying and Geo-Informatics (or Geomatics). The Department has close links with both international and local academic institutions and the professions. By maintaining links with the local professional community through our community service and consultancy activities, our courses and research are oriented towards the needs of Hong Kong.

The Department has identified Urban Informatics and Smart City as its strategic area, with three corresponding focused research directions: a) spatial big data modelling and analytics; b) smart positioning and smart mobility; and c) urban sensing and measurement. As a regional centre of excellence in geomatics research, LSGI is comparable with international reputed academic units in the discipline, as evidenced by both the quantity and quality of the research produced and research grants received.

#### 2. Aims and Learning Outcomes

The Research student programmes aim to provide rigorous training to students who aspire to become researchers or scholars capable of conducting independent and original research, and producing research findings that are relevant and significant to their chosen field of specialisation. To be awarded the degree, students must demonstrate their research competence by submitting a thesis and successfully defending it in an oral examination.

Research students (MPhil and/or PhD) must satisfactorily investigate or evaluate a chosen area, demonstrate understanding of the context and significance of the work, display sustained independent effort and original thought, and present a clear, complete thesis of a quality worthy of publication. For PhD students, they are also expected to produce evidence and argument supporting an original proposition or rigorous testing and analysis of others propositions, that results in a significant contribution to knowledge in the subject area.

The research degree programmes are designed in such a way to enable the student to:

- Acquire competence in research methods and scholarship;
- Display sustained independent effort and original thought;
- Develop competence in disseminating and communicating their work; and
- Gain lifelong learning capability.

#### 3. PhD/MPhil Programmes

- PhD Programme in Geomatics
- MPhil Programme in Geomatics
- PhD Programme in Urban Informatics and Smart City
- MPhil Programme in Urban Informatics and Smart City

Geomatics is the discipline of acquiring, processing, managing, modelling and delivering spatially referenced information about the earth and other planets, for a variety of applications such as construction, environment, navigation and transportation. In the discipline of Geomatics, the research areas include Cadastre Survey, Cartography, Geodesy and Geodynamics, Geographic Information Science, GNSS and Positioning systems, hydrographic surveying, Photogrammetry, Navigation technology, Remote Sensing, Utility Surveying.

Urban informatics and Smart Cities is a trans-disciplinary field that draws on three broad domains, i.e. people, place and technology, with ultimate goal of achieving smarter mobility, smart living, smart environment and smart people. This new field is enabled by the increasing availability of big and geographically-rich new urban data, the development of geo-information technologies, and the growth of sensors and connected systems. In the discipline of Urban Informatics and Smart City, the research areas include Urban-scape and environment, Urban Systems and Dynamics, Urban Sensing, Ubiquitous Technologies, Big Urban data Analytics and Visualization, etc.

#### Notes:

- 1. English enhancement subjects for all RPg students. For exemption, RPg students need to pass the Research Language Skills Assessment (RLSA).
- 2. Compulsory Subjects for all PolyU RPg students.
- 3. Compulsory Subject for full-time FCE research students who registered on/after 2 July 2009, and part-time FCE research students who registered on/after 2 July 2014.
- 4. Compulsory Subject for full-time and part-time FCE research students who registered on/after 2 July 2014.
- Attendance at Seminars is compulsory for all PolyU RPg students (Total 2 credits for MPhil students / Total 3 credits for 3-year PhD students / Total 4 credits for 4-year PhD students).
- 6. Practicum is compulsory for all PolyU PhD students.

University Compulsory Subjects

| Subject Code        | ELC6001  |
|---------------------|--|
| Subject Title       | Presentation Skills for Research Students  |
| Credit Value        | Nil  |
| Pre-requisite /     | Nil  |
| Co-requisite/       |  |
| Exclusion           |  |
| Objectives          | This subject aims to develop the spoken English language and communication skills required by research students to present their research projects effectively in academic contexts. |
| Intended Learning   | By the end of the subject, students should be able to present their research to  |
| Outcomes            | academic audiences in research-related contexts such as conferences and vivas  |
|                     | through  |
|                     | a. planning, organising and delivering effective oral presentations, and   |
|                     | b. reporting and defending their research.   |
|                     |  |
|                     | To achieve the above outcomes, students are expected to use language and   |
|                     | organisational structure appropriate to the context, select information critically,  |
|                     | justify various aspects of the research, present and support stance and opinion, and   |
|                     | analyse the impact and significance of the research.   |
|                     |  |
| Subject Synopsis/   | The content is indicative. The balance of the components, and the corresponding  |
| Indicative Syllabus | weighting, will be based on the specific needs of the students.  |
|                     |  |
|                     | 1. Planning and organising presentations   |
|                     | Identifying purposes and audiences; selecting and organising information and   |
|                     | ideas; using appropriate organisational patterns.  |
|                     |  |
|                     | 2. Using visual aids in presentations  |
|                     | Analysing the characteristics of different types of commonly-used visual aids;   |
|                     | selecting visual aids; planning and preparing visual aids; describing graphics;  |
|                     | practising the techniques of using different visual alds.  |
|                     |  |
|                     | 3. Delivering presentations  |
|                     | Using transitions; signposting the presentation; selecting appropriate register;   |
|                     | employing non-verbal interactive strategies; nandling questions.   |
| Teaching/Learning   | The study method is primarily seminar-based. Activities include teacher input as well  |
| Methodology         | as individual and group work. Students will be provided with opportunities to practice   |
|                     | giving oral presentations related to their research. Through practice supported by   |
|                     | video-recording students will learn to evaluate their presentations and obtain advice  |
|                     | on presentations related to their research. Students will be referred to information   |
|                     | on the Internet and the ELC's Centre for Independent Language Learning   |
|                     |  |
|                     | Learning materials developed by the English Language Centre are used throughout  |
|                     | this course. Additional reference materials will be recommended as required.   |
|                     |  |

| Assessment           | Continuous assessment: 100%  |                          |  |  |  |  |  |  |
|----------------------|--|--------------------------|--|--|--|--|--|--|
| Methods              |  |                          |  |  |  |  |  |  |
|                      | Students' oral skills are evaluated through assessment tasks related to the learning outcomes. Students are assessed on the fluency, accuracy and appropriacy of the language used in fulfilling the assessment tasks, as well as the selection and organisation of ideas. |                          |  |  |  |  |  |  |

| Subject Code        | HTI6081   |
|---------------------|---|
| Subject Title       | Ethics: Research, Professional & Personal Perspectives  |
| Credit Value        | 1   |
| Level               | 6   |
| Pre-requisite /     | None  |
| Co-requisite/       |   |
| Exclusion           |   |
| Objectives          | To equip students with a deep appreciation of ethical guidelines and codes of conduct             |
|                     | that they can apply in their research studies at PolyU and in their future professional           |
|                     | and personal lives.   |
| Intended Learning   |   |
| Outcomes            | On successful completion of this subject, students will be able to:                               |
| outcomes            | a. Demonstrate knowledge and understanding of the need for ethical behavior                       |
|                     | and guiding codes of ethics in research and theprofessions.                                       |
|                     | b. Understand, discuss and apply ethical principles and codes across a range of                   |
|                     | disciplines and scenarios   |
|                     | c. Demonstrate awareness of current ethical issues and problems in relation to                    |
|                     | their own discipline and research area  |
|                     | d. Critically analyze and discuss scenarios cases of possible or actual ethical                   |
|                     | misconduct  |
|                     | e. Discuss how the guiding principles of ethics in research extend and apply to                   |
|                     | business, professional and personal codes of conduct and why this important                       |
|                     | to integrity and the well being of business, the professions and our                              |
|                     | community.  |
|                     | f. Show a fundamental understanding of the issues of copyright, plagiarism and                    |
|                     | proper citation, and be able to apply this in their ownwork.                                      |
|                     |   |
| Subject Synopsis/   | <ul> <li>The need for ethics training and the meaning of ethical behavior in research:</li> </ul> |
| Indicative Syllabus | case studies, disasters and learning by the mistakes of others                                    |
|                     | <ul> <li>Philosophy and codes of ethics and theirorigins</li> </ul>                               |

## Faculty Subjects

| Subject Code                                  | CE603  |
|---|--|
| Subject Title                                 | Research Frontiers in Construction and Environment   |
| Credit Value                                  | 3  |
| Level   | 6  |
| Pre-requisite /<br>Co-requisite/<br>Exclusion | Nil  |
| Objectives                                    | <ol> <li>This subject is intended to provide students with:</li> <li>a good understanding of the research foci and achievements of the Faculty and<br/>its constituent departments</li> <li>a broad perspective of key research issues in the broad field of construction and<br/>environment</li> <li>general knowledge of the current status and future challenges of key research<br/>areas of FCE and their relationship with the student's own research</li> <li>an exposure to different research cultures, techniques and approaches employed<br/>in different research areas and how they may be exploited in the student's own<br/>work</li> <li>opportunities to interact with leading scholars from the four constituent<br/>departments of FCE</li> <li>opportunities to interact with fellow research students to lay the groundwork<br/>for future collaborations</li> </ol> |
| Intended Learning<br>Outcomes                 | <ul> <li>Upon completion of the subject, students will possess:</li> <li>a. a broad perspective of key research issues in the field of construction and environment;</li> <li>b. a good knowledge of the wide range of expertise available in the Faculty;</li> <li>c. an understanding of the different approaches employed in different research areas; and</li> <li>d. an awareness of opportunities for research collaborations in the Faculty.</li> </ul>   |
| Subject Synopsis/<br>Indicative Syllabus      | Overview of Research in FCE and selected topics in the field of construction and<br>environment which may include:<br>Urban Planning and Management; Construction Management; Construction<br>Technology; Building Environmental Performance; Energy Efficient Building<br>Technologies; Renewable Energy Applications; Transportation Engineering;<br>Structural Engineering; Environmental Science and Engineering; Geotechnical<br>Engineering; Hydraulic and Coastal Engineering; Remote Sensing and Geographic<br>Information Systems; and Modern Positioning Technology.   |
| Teaching/Learning<br>Methodology              | A group of academic staff from the four constituent departments of FCE will share<br>the teaching of the subject. The lecturers will all be active researchers in their fields<br>and they will each provide a critical exposition of the current status and future<br>challenges in their own/related research areas. Ample opportunities will be provided<br>for classroom discussions.  |

| Objectives                               | Inis course provides an overview of quantitative methods used for design and analysis   |
|  | Discrete Event Simulation (DES) System Dynamics (SD) and Agent Based Simulation   |
|  | (ABS).  |
|  | This subject intended to equip students with an understanding of the roles of Geo-IT  |
|  | and Building Information Modeling (BIM) in practice and research, and introduce a   |
|  | state-of-the-art Geo-IT and BIM-based technologies for construction simulation and  |
|  | management.   |
| Intended Learning                        | Upon completion of the subject, students will be able to:   |
| Outcomes                                 | a. Understand the fundamentals of simulation and IT principles.   |
|  | b. Understand the techniques of data analysis and modelling in simulation and IT  |
|  | areas.  |
|  | c. Apply knowledge of simulation and 1 to construction projects.  |
|  | <ol> <li>Communicate with others in a clear and articulated manner.</li> <li>Identify and assess solutions to construction modulation in a descentation.</li> </ol>   |
|  | e. Identify and propose solutions to construction productivity and presentation   |
|  | problems.   |
|  | <ol> <li>Identify and study the appropriateness, advantages, and limitations of each<br/>size letites and the second study of the second statement of the second statement of the second statement of the<br/>second statement of the second statement of</li></ol> |
|  | simulation and IT techniques for different construction problems.   |
|  |   |

|--|---|
| Subject Title                            | Advanced Energy Technologies and Analytics  |
| Credit Value                             | 3   |
| Level                                    | 6   |
| Pre-requisite /                          | Nil   |
| Co-requisite/<br>Exclusion               |   |
| Objectives                               | This subject aims to introduce the advanced energy technologies and the associated<br>analytical methodologies for three important applications: energy optimization and<br>diagnostic technologies to reduce energy demand, technologies for effective use of<br>various renewable energy resources, and thermal/electrical energy storage<br>technologies.  |
| Intended Learning<br>Outcomes            | <ul> <li>a. Able to appreciate and select proper advanced energy technologies for energy saving, effective use of renewable energy and power supply-demand balance in the context of buildings and districts;</li> <li>b. Able to analyze quantitatively the above energy technologies for the purposes of technologies integration, optimization and operation/control;</li> <li>c. Able to identify the limitations of the technologies in applications and gaps which need for further development.</li> </ul> |
| Subject Synopsis/<br>Indicative Syllabus | <b>Design and control optimization technologies:</b> Uncertainty analysis and uncertainty-<br>based control and design, modelling and optimization for real-time applications, smart<br>grid, demand response methods and grid-responsive buildings.<br><b>Diagnostic technologies:</b> Data analytics for building performance diagnostics:  |
|  | (measurement quality, data fusion and data-driven methods); Big Data analytics and<br>their applications in buildings (data mining techniques, supervised learning and<br>unsupervised learning).   |
|  | <b>Solar energy technologies:</b> Passive solar energy, building-integrated solar photovoltaics, solar cells (thin film solar cells, perovskite solar cells, dye-sensitized solar cells, organic solar cells), solar thermal energy (solar collectors, solar air- conditioning).  |
|  | Wind and geothermal energy technologies: wind power fundamentals, wind turbine technologies (horizontal axis, vertical axis, building-integrated), offshore wind farm, hybrid solar-wind generations, ground source heat pumps.   |
|  | <b>Energy storage technologies:</b> Thermal energy storage and phase change materials (PCM); Various fuel cells, such as proton exchange membrane fuel cells (PEMFCs), solid oxide fuel cells (SOFCs), and microbial fuel cells; Various batteries, such as Li-ion battery, Li-air battery, and Zn-air battery.   |
| Teaching/Learning<br>Methodology         | Teaching periods will adopt a range of methods which include lectures, guided reading, tutorials, and small projects. The lectures aim to provide the students fundamental concepts and principles as well as quantitative analytic methods of advanced energy technologies. Guided reading will guide students in reading the literature on the selected topics. Tutorial will be used to develop students' problem solving skills. Students will be asked to complete a small project on a selected topic.      |

| Assessment        |   |           |                                    |   |   |          |          |    |        |  |

|                   | Total   | 100%      |                                    |   |   |          |          |    |        |  |
|                   | Assessments of the subject will be based on coursework (25%), in-class tests (25%), and final examination (50%).<br>* <u>Oral Examination:</u> Each student will be assessed by two lecturers on two subjects out of the above five topics respectively, each for about twenty minutes on each subject (about 40 minutes for each student). Each student can select one subject and the second is randomly assigned by the subject examiner. The oral examination of each subject consists of two sessions. The first session is the Q/A session on the questions/items given by the lecturer. The second session is the student led discussion. The student will give his/her views and discuss with the lecturer on one topic selected by himself/herself within the subject area. The objective of both sessions is to evaluate the students' understanding and ability in using the knowledge learnt from the viewpoints of depth and breadth. On each subject, a set of basic items/questions will be developed and the lecturer will choose some of these items in the first session of the oral examination. |           |                                    |   |   |          |          |    |        |  |

| Objectives                                    | This course aims to provide in-depth knowledge and hands-on techniques on the urban big data mining. This course will introduce the concept of urban big data, and the methods for acquiring, processing, and analyzing these data sets. It will also introduce applications in environment, transportation, housing, urban, business, and socio-economics. The research issues in urban big data includes challenges from the automated data management, cloud computing, tackling massive flow, security and privacy problems. This course will cover these issues.   |
| Intended Learning<br>Outcomes                 | <ul> <li>Upon completion of the subject, students will be able to:</li> <li>a. Understand the definition and principles of urban big data</li> <li>b. Obtain broad knowledge in fundamental concepts, algorithms and techniques for big data mining and their applications to large-scale data warehouses and big data analytics</li> <li>c. Understand research issues and topics in big data mining and analytics</li> </ul>  |
| Subject Synopsis/<br>Indicative Syllabus      | <ul> <li>Introduction of urban big data</li> <li>Big data acquisition</li> <li>Big data processing <ul> <li>Aggregation</li> <li>Systematic, stochastic, and gross error cleaning</li> <li>Graphic and image cleaning</li> <li>Information delivery</li> </ul> </li> <li>Method and techniques in big data analysis and mining <ul> <li>Visualization and spatial-temporal analytics</li> <li>Crisp set theory</li> <li>Extended set theory</li> <li>Bionic method</li> <li>GIS data mining</li> <li>Remote sensing image mining</li> </ul> </li> <li>Urban big data applications <ul> <li>Transportation</li> <li>Traffic monitoring</li> <li>Urban planning</li> <li>Smart cities</li> <li>logistics</li> <li>Urban Infrastructure</li> <li>Business</li> <li>Internet of Things</li> </ul> </li> </ul> |

# <u>Departmental Subjects</u> Building and Real Estate

| Subject Code        | BRE6812   |
|---------------------|---|
| Subject Title       | Productivity in Construction  |
| Credit Value        | 3   |
| Level               | 6   |
| Pre-requisite /     | Nil   |
| Co- requisite/      |   |
| Exclusion           |   |
| Objectives          | This course provides an overview of quantitative methods used to assess and<br>analysis labor and equipment productivity in construction operations. The students<br>will study various types of equipment including earth moving equipment<br>(excavators, loaders, dozers, scrapers, trucks, etc.); cranes; mixing, transporting,<br>and placing concrete; piling; paving; tunneling; etc. Innovative and smart methods<br>used to monitor and select the appropriate equipment, its optimal number, capacity<br>and location.<br>Labor productivity will cover the examination of its definitions, what it measures,<br>why it is important, how it affects the total economy, and the main factors affecting<br>its growth. The students will study how to calculate labor productivity, understand<br>the importance of measuring labor productivity, and policies to improve labor<br>productivity, in terms of investment in physical capital, quality of education and<br>training, and technological progress. |
| Intended Learning   | Upon completion of the subject, students will be able to:   |
| Outcomes            | (a) Understand the fundamentals of labor and equipment productivity   |
| (Note 1)            | <ul> <li>assessment.</li> <li>(b) Identify and study the different factors that impact labor and equipment productivity in construction.</li> <li>(c) Understand the techniques of data analysis and modelling in labor and equipment productivity.</li> <li>(d) Apply knowledge of labor and equipment productivity to construction projects.</li> <li>(e) Communicate with others in a clear and articulated manner.</li> <li>(f) Identify and propose solutions to construction productivity and presentation problems.</li> <li>(g) Identify and study the appropriateness, advantages, and limitations of various types of labors and equipment for different construction problems.</li> </ul>  |
| Subject Synopsis/   | The subject will cover the following content:   |
| Indicative Syllabus |   |
| (Note 2)            | <b>Equipment Productivity:</b> a brief initial introduction to equipment productivity, factors that affect various types of construction equipment, discussion of productivity modeling, assumptions, and limitations in construction applications. The students will also study various types of equipment including earth moving equipment (excavators, loaders, dozers, scrapers, trucks, etc.); cranes; mixing, transporting, and placing concrete; piling; paving; tunneling; etc. This part will also discuss the innovative and smart methods used to monitor and select the appropriate equipment, its optimal number, capacity and location.   |
|                     | Labor Productivity: introduction to the principles of modeling labor productivity<br>and its application to construction activities, examination of productivity<br>definitions, what it measures, why it is important, how it affects the total economy,<br>and the main factors affecting its growth. The students will study how to calculate<br>labor productivity, understand the importance of measuring labor productivity, and  |

|   | policies to improve labor productivity, in terms of investment in physical capital, quality of education and training, and technological progress. Specific emphasis will be placed on modeling labor productivity in heavy and highway construction, underground and tunneling construction, and building construction.   |  |                             |                               |                             |                              |  |                             |                            |
|---|--|--|-----------------------------|-------------------------------|-----------------------------|------------------------------|--|-----------------------------|----------------------------|
| Teaching/Learning<br>Methodology<br>(Note 3)                                | The course includes a combination of lectures, assigned readings, quizzes, a series of weekly individual assignments, and a class project (term project) for modeling and analyzing actual labor and equipment productivity in construction operations in addition to two exams.   |  |                             |                               |                             |                              |  |                             |                            |
|   | The lectures aim to provide the students fundamental concepts and principles of advanced productivity assessment to solve construction problems. Assigned readings from literature will guide students to better understand the discussed material through active learning approach. Assignments will improve the problem solving skills for students. Students will be asked to complete a term project on their topic of interest.   |  |                             |                               |                             |                              |  |                             |                            |

#### Note 1: Intended Learning Outcomes

Intended learning outcomes should state what students should be able to do or attain upon subject completion. Subject outcomes are expected to contribute to the attainment of the overall programme outcomes.

#### Note 2: Subject Synopsis/Indicative Syllabus

The syllabus should adequately address the intended learning outcomes. At the same time, overcrowding of the syllabus should be avoided.

#### Note 3: Teaching/Learning Methodology

This section should include a brief description of the teaching and learning methods to be employed to facilitate learning, and a justification of how the methods are aligned with the intended learning outcomes of the subject.

#### Note 4: Assessment Method

This section should include the assessment method(s) to be used and its relative weighting, and indicate which of the subject intended learning outcomes that each method is intended to assess. It should also provide a brief explanation of the appropriateness of the assessment methods in assessing the intended learning outcomes.

| Subject Code           | BRE666  |
|------------------------|---|
| Subject Title          | Numerical Methods for Engineers   |
| Credit Value           | 3   |
| Level                  | 6   |
| Pre-requisite /        | Nil   |
| Co- requisite/         |   |
| Exclusion              |   |
| Objectives             | This subject aims to provide students the basic concepts, methodologies and skills  |
|                        | of solving engineering problems numerically with computers.   |
| Intended Learning      | Upon completion of the subject, students will be able to:   |
| Outcomes               | a. find the root of an equation by bisection method and Newton-Raphson  |
|                        | method;   |
|                        | b. solve algebraic equations by Gauss elimination, LU decomposition and matrix  |
|                        | inversion, Gauss-Seidel iteration method;   |
|                        | c. apply least-squares regression and interpolating polynomials for curve-  |
|                        | fitting and plotting experimental data;   |
|                        | d. apply Newton-Cotes integration formulas for numerical integration and  |
|                        | finite difference method for numerical differentiation;   |
|                        | e. apply finite difference methods for solving ordinary and partial differential  |
|                        | equations, including Euler's method, Runge-Kutta method, and Crank-   |
|                        | Nicolson method.  |
|                        | T. apply statistical methods for data analysis  |
| Subject Synopsis/      | Introduction to Numerical and Statistical Methods   |
| Indicative<br>Syllabus | <b>Roots of non-linear equations</b> – Bracketing method. Bisection method. Open methods. Newton-Raphson method. Secant method. Brent's method.   |
|                        | <b>Linear algebraic equations</b> – Gauss elimination. LU Decomposition and Matrix Inversion. Gauss-seidel iteration.   |
|                        | <b>Curve fitting and interpolating</b> – Least square regression. Linear regression. Polynomial regression. Nonlinear regression. Interpolation. Lagrange interpolating polynomials. Newton's divided-difference interpolating polynomials. Spline interpolation.           |
|                        | Numerical integration and differentiation – Newton-Cotes integration formulas.<br>Trapezoidal rule. Simpson's rules. Romberg integration. Taylor's series expansion.<br>Richardson extrapolation.   |
|                        | <b>Differential equations</b> – Euler's method. Runge-Kutta method. Systems of equations. General methods for boundary-value problems. The shooting method. Finite difference method; Explicit methods. Crank-Nicolson method. Alternating-direction implicit (ADI) scheme. |
|                        | Statistical methods for Building Engineers, Surveyors and Project Managers -<br>Elementary measurements of central tendency and dispersions; Probability and<br>probability distributions; Collection of data, sampling, sampling distributions                             |

|                                  | Estimation and hypothesis testing; Goodness of fit and testing of independence Simple and multiple regression;  |               |               |              |          |                        |              |              |      |
|----------------------------------|---|---------------|---------------|--------------|----------|------------------------|--------------|--------------|------|
|                                  | Software application: SPSS  |               |               |              |          |                        |              |              |      |
| Teaching/Learning<br>Methodology | Teaching periods will adopt a range of methods which include lectures and tutorials.<br>The lectures aim to provide the students fundamental concepts and principles of<br>numerical methods. Tutorial will be used to develop students' problem solving<br>skills. Where appropriate, the use of computer assisted learning techniques will be<br>employed.<br>The intention is to create an environment that encourages active learning. Students<br>will be encouraged to apply the numerical techniques to solve practical engineering<br>problems.   |               |               |              |          |                        |              |              |      |

| Credit Value                                  | 3   |
| Level   | 6   |
| Pre-requisite /<br>Co-requisite/<br>Exclusion | Mutual exclusions: BSE531 Computational Fire Modelling for Building Design  |
| Objectives                                    | As the computer capacity becomes more and more powerful, and the commercial CFD packages are more widely available, there are increased applications of CFD in postgraduate studies, which eventually will lead to more industrial applications. However, due to the special expertise required, few PhD candidates have the proper fundamental studies with regard to turbulence theory and turbulence modeling, and the special numerical schemes employed to solve the Navier-stokes Partial Differential Equations, which greatly hinders their start-up and further indepth application of the technique. Therefore, this subject is conceived to fill-up this knowledge gap.  |
| Intended Learning<br>Outcomes                 | <ul> <li>Upon completion of the subject, students will be able to:</li> <li>a. critically examine turbulence models and understand the limitations of each model;</li> <li>b. select propermodels in fluid flow simulation: laminar, RANS or LES;</li> <li>c. treat buoyancy forces;</li> <li>d. use commercial code to simulate flow problems <ol> <li>grid generation, boundary condition setting</li> <li>selection of numerical schemes and solution procedures</li> <li>iii. convergence control and checking, and</li> <li>iv. visual and numerical presentation of simulation results; and</li> </ol> </li> <li>e. solve steady state and transient flow and heat transfer problems.</li> </ul>  |
| Subject Synopsis/<br>Indicative Syllabus      | <ol> <li>Conservation equations in fluid flow. 3-d Navier-Stokes Equations, buoyancy<br/>force approximation.</li> <li>Concepts of turbulence – Reynolds' experiment, and turbulence<br/>measurements and characterization.</li> <li>Reynolds average of flow parameters.</li> <li>Time Average Momentum Equations for turbulence flow.</li> <li>Closure of the Time-Average Equations – turbulence modeling<br/>5.1 Concept of eddy viscosity – Boussinesq Hypotheses<br/>5.2 Concept of mixing length</li> <li>3.3 One Equation models, two equation models, esp. k-ɛmodel<br/>5.4 Reynolds stress equation models</li> <li>5.5 Large eddy simulation (LES) and Direction solution of N-Sequations</li> <li>Boundary conditions, the log-wall function method.</li> </ol> |

| Objectives                                   | This course will allow students to understand the fundamentals of fire science and concepts of compartment fire dynamics. It will also help them to develop an understanding of fire growth and the fully developed fire and methods by which potential fire severity can be assessed. Students will learn the application of fire science and fire dynamics for the safety of occupants in buildings, including active and passive fire protection system, the detection, suppression and limiting spread of fire and smoke, and regulatory provisions for fire safety. This course will introduce sufficient knowledge to students and enable them to become future fire protection engineers.  |
| Intended Learning<br>Outcomes                | <ul> <li>Upon completion of the subject, students will be able to:</li> <li>a. Demonstrate a working knowledge of basic physical and chemical processes in various fire phenomena</li> <li>b. Understand the mechanism of ignition, flame spread, and extinction</li> <li>c. Apply basic sciences to the fire safety design of building</li> <li>d. Identify the fire risk and hazard, and formulate and solve engineering problems representative of those commonly encountered in the fire protection engineering practice</li> <li>e. Recognize the need to engage in life-long learning and ability to maintain state of the art fire protection engineering knowledge and skills.</li> </ul> |

| Teaching/Learning<br>Methodology   | The teaching will involve lecture, Fire lab and computing sessions, tutorials and problem solving, and course projects.<br>The course project includes the learning of the most successful CFD-based fire code, Fire Dynamics Simulation (FDS), developed by National Institute of Standards and Technology (NIST). Students will learn to use this academic code to further understand the fire behaviours and simulate the smoke propagation in the building fire. By doing this course project, students will be able to conduct fire safety assessment in the design of building, and reproduce the fire process in the case of fire investigation. |   |                      |                  |                                  |                      |                    |               |  |  |

| Pre-requisite /                          | Students should have basic knowledge of physics and mathematics.   |
| Co-requisite/                            |  |
| Exclusion                                |  |
| Objectives                               | This subject aims to provide students with an in-depth understanding of the impact<br>of indoor and outdoor environmental quality on building performance, in terms of<br>air quality, lighting, acoustics, thermal and wind comfort and equip research<br>students with advanced experimental and/or modeling skills for conducting indoor<br>and outdoor environmental research.   |
|  | Students are expected to understand the role of human factors in indoor and outdoor environment and how building design can affect the indoor and outdoor environments, and how to make evaluation through site measurement, and computer simulation. The subject will also cover the latest building environmental assessment schemes, such as BEAM Plus and LEED. The students will be divided into groups to finish a group project which will include site measurement and computer simulation. The subject will include lecture, workshop, computer lab session, and seminar. |
| Intended Learning                        | Upon completion of the subject, students will be able to:  |
| Outcomes                                 | <ul><li>a. understand the role of human factors in indoor and outdoor environmental performance and how building design can affect the indoor and outdoor environments.</li><li>b. apply learned knowledge and skills in indoor and outdoor environmental research to conduct evaluation through site measurement, and computer simulation.</li></ul>  |
| Subject Synopsis/<br>Indicative Syllabus | This subject covers the following contents:  |
|  | 1. Indoor environmental quality in relation to building design:  |
|  | Introduction to thermal comfort, lighting, acoustics and indoor air quality including their definition, basic parameters, evaluation and simulation. Effects on human. Relationship between indoor environmental quality and building design. examples.  |
|  | <ol> <li><u>Dataser</u> environmental gains in relation to banking design<br/>Introduction to outdoor environment in terms of acoustics (e.g. CRTN<br/>method), wind and thermal comfort (e.g. wind comfort criteria), air quality<br/>including definition, basic parameters, evaluation, prediction and simulation.<br/>Effects on human. Relationship between outdoor environment and building<br/>design. examples.</li> <li><b>Bating of indoor and outdoor environmental performance</b></li> </ol>  |
|  | BEAM Plus and LEED. Indoor environmental quality management strategies.<br>Assessment of indoor and outdoor environment.   |

| Teaching/Learning<br>Methodology   | The students will be asked to conduct an individual project which will include site<br>measurement and/or computer simulation. The subject will include lectures,<br>workshops, computer lab session, and seminars.<br>Lectures: will introduce fundamental knowledge and theoretical basis for indoor<br>and outdoor environments.<br>Workshops/seminars: Students are required to present and discuss key problems<br>and potential issues for selected case studies.<br>Individual project: Students are required to prepare an individual report based on<br>a specific indoor or outdoor environmental issues. Students are also required to<br>give an oral presentation. |                       |   |   |  |  |   |       |     |

| Subject Synopsis/<br>Indicative Syllabus                     | Full-time students are required to attend at least 10 research seminars per academic year, in addition to workshops/conferences, and to submit a record of seminars attended to the Chief Supervisor for endorsement. A report of no less than 1,500 words (excluding references) on one of the attended seminars every year is also required to be submitted to the Chief Supervisor for assessment.   |  |  |  |  |
|  | Part-time students are required to attend at least 10 research seminars per two academic years, in addition to workshops/conferences, and to submit a record of seminars attended to the Chief Supervisor for endorsement. A report of no less than 1,500 words (excluding references) on one of the attended seminars once every two years is also required to be submitted to the Chief Supervisor for assessment.  |  |  |  |  |
|  | The research seminars may or may not be organised by the Department of Building<br>Services Engineering and are expected to last not less than an hour each. The topic<br>of the seminar reported on should not be related directly to the thesis title of the<br>student.  |  |  |  |  |
| Assessment Methods<br>in Alignment with<br>Intended Learning | Chief Supervisors are required to assess the report (with a pass or failure grade).<br>Students who failed to submit a report to the satisfaction of their Chief Supervisor<br>are required to make a re-submission until a pass grade is obtained.   |  |  |  |  |
| Outcomes   | Students should be awarded one credit per year (for full-time students) or per two years (for part-time students) for completing the research seminar credit requirement, with an overall assessment grade of Pass and Fail. However, as deemed appropriate by the Chief Supervisor, students are allowed to complete at most two credits per year (for full-time students) or per two years (for part-time students) to fulfill the above-mentioned requirement. |  |  |  |  |

| Intended Learning<br>Outcomes                                | <ul><li>a. Understand the importance and strategic value of research and development.</li><li>b. Develop effective communication skills for both academic and non-academic communities.</li></ul>   |  |  |  |  |
| Subject Synopsis/<br>Indicative Syllabus                     | Full-time students are required to attend at least 10 research seminars per academic year, in addition to workshops/conferences, and to submit a record of seminars attended to the Chief Supervisor for endorsement. A report of no less than 1,500 words (excluding references) on one of the attended seminars every year is also required to be submitted to the Chief Supervisor for assessment.   |  |  |  |  |
|  | Part-time students are required to attend at least 10 research seminars per two academic years, in addition to workshops/conferences, and to submit a record of seminars attended to the Chief Supervisor for endorsement. A report of no less than 1,500 words (excluding references) on one of the attended seminars once every two years is also required to be submitted to the Chief Supervisor for assessment.  |  |  |  |  |
|  | The research seminars may or may not be organised by the Department of Building Services Engineering and are expected to last not less than an hour each. The topic of the seminar reported on should not be related directly to the thesis title of the student.   |  |  |  |  |
| Assessment Methods<br>in Alignment with<br>Intended Learning | Chief Supervisors are required to assess the report (with a pass or failure grade).<br>Students who failed to submit a report to the satisfaction of their Chief Supervisor<br>are required to make a re-submission until a pass grade is obtained.   |  |  |  |  |
|  | Students should be awarded one credit per year (for full-time students) or per two years (for part-time students) for completing the research seminar credit requirement, with an overall assessment grade of Pass and Fail. However, as deemed appropriate by the Chief Supervisor, students are allowed to complete at most two credits per year (for full-time students) or per two years (for part-time students) to fulfill the above-mentioned requirement. |  |  |  |  |

## <u>Departmental Subjects</u> **C**ivil and **E**nvironmental **E**ngineering

| Subject Code   | CSE6010   |
|--|---|
| Subject Title  | Nonlinear Finite Element Analysis of Structures   |
| Credit Value   | 3   |
| Level  | 6   |
| Pre-requisite /                                      | Students should possess a basic understanding of elasticity, plasticity, and linear   |
| Co-requisite/  | finite element analysis of structures from first courses on these topics or through   |
| Exclusion  | self-learning   |
| Objectives   | <ul> <li>This subject is intended to</li> <li>(a) Expose students to common geometrically and materially nonlinear phenomena of civil engineering structures;</li> <li>(b) Equip students with a good understanding of plasticity-based constitutive modelling for steel and other materials; and</li> <li>(c) Provide students with a good knowledge of the concepts and techniques of the finite element method as employed in the nonlinear numerical analysis of structures under static and dynamic loads.</li> </ul>  |
| Intended Learning<br>Outcomes<br>(Note 1)            | <ul> <li>Upon completion of the subject, students will be able to: <ul> <li>a. Develop finite element models for static and dynamic problems;</li> <li>b. Explain clearly the stress-strain-strength of metals, concrete, rock and soils and their constitutive modeling;</li> <li>c. Explain clearly geometric nonlinearity and its modellingtechniques;</li> <li>d. Conduct reliable and efficient static or dynamic nonlinear finite element analyses using a general-purpose package by making informed choices of element types, boundary conditions, constitutive models, solution procedures, etc.;</li> <li>e. Interpret and evaluate results from nonlinear finite element analyses in a sensible manner.</li> </ul> </li> </ul>   |
| Subject Synopsis/<br>Indicative Syllabus<br>(Note 2) | <ol> <li>This subject covers the following aspects:         <ol> <li><u>Review of fundamental concepts of finite element method</u></li> <li>Finite element formulation by Weighted Residual Method; Iso- parametric formulation, Numerical integration; Solution by frontal solver; Solution of eigenvalue problems; Method of sub-space iterations; Types of elements.</li> </ol> </li> <li><u>Geometric nonlinearity</u>         Finite element vs stability function; Element with initial imperfection for second-order analysis; Newton Raphson Method; Displacement control method for tracing of equilibrium path; Snap-through and snap-back buckling. Second-order direct analysis applied to structural design.         </li> <li><u>Material nonlinearity and constitutive models for metals</u></li> </ol> |

|   | <ul> <li>Elastic-plastic behavior of metals; Yield surfaces; Flow theory of plasticity;<br/>Associated versus non-associated plasticity; Tresca model; Von Mises model;<br/>Incremental stress-strain relationships; Tangent stiffness matrix; Brief<br/>introduction to finite element programs for solids.</li> <li>4. <u>Constitutive models for concrete</u></li> <li>Elastic-plastic behavior of concrete; Yield surfaces for concrete; Rate effects;<br/>Drucker-Prager model; Mohr-Coulomb model; Plastic-damage model.</li> <li>5. <u>Dynamic nonlinear analysis of structures</u></li> <li><u>Linear dynamics</u>: Equations of motion; Mass matrix (lumped mass, consistent<br/>mass); Damping matrix (Rayleigh damping and modal damping); Central<br/>difference method; Newmark's method. <u>Nonlinear dynamics</u>: Incremental<br/>equations of motion; Computational errors. <u>Seismic analysis</u>: Ground motion;<br/>Seismic equations of motion; Response spectrum; Ductility demand; Capacity<br/>spectrum; Incremental dynamic analysis.</li> </ul> |  |  |   |  |  |  |         | ent<br>s;<br>ent<br>atal<br>on;<br>sity |
|---|--|--|--|---|--|--|--|---------|---|
| Teaching/Learning<br>Methodology<br>(Note 3)  | The subject is delivered mainly through lectures focused on the theory and techniques of nonlinear finite element analysis of structures. The lectures need to be supplemented by substantial self-study after class by students of reference materials recommended by subject lecturers.<br>Students need to each complete a set of assignments on small numerical modeling problems. Each student also needs to undertake a numerical modeling project using a general-purpose finite element package. These modeling exercises will provide students with hands-on experience and opportunities to put theory into  |  |  |   |  |  |  |         |   |
| Assessment<br>Methods in<br>Alignment with<br>Intended Learning<br>Outcomes<br>(Note 4) | Specific assessment<br>methods/tasks<br>1. Assignments<br>2. Project report<br>3. Quiz<br>4. | Subject Code                                  | CSE6012   |
|---|---|
| Subject Title                                 | Advances in Geotechnical and Pavement Engineering   |
| Credit Value                                  | 3   |
| Level   | 6   |
| Pre-requisite /<br>Co-requisite/<br>Exclusion | <u>Recommended background knowledge:</u><br>Students should have a knowledge and understanding of engineering mathematics,<br>engineering mechanics, soil mechanics, and foundation engineering consistent<br>with undergraduate level study in civil engineering.  |
| Objectives                                    | <ol> <li>To provide students with the knowledge about the fundamental properties<br/>and behavior of earth materials, mathematical models, and methods of<br/>analysis for different conditions.</li> <li>To provide students with in-depth analysis and design of common geotechnical</li> </ol>   |
|   | <ul><li>structures and solutions to real problems.</li><li>3. To provide students with practical knowledge of pavement material and pavement behavioral analysis</li></ul>  |
| Intended Learning<br>Outcomes                 | <ul> <li>Upon completion of the subject, students will be able:</li> <li>a. to apply the knowledge about the behavior of earth materials and their constitutive models in geotechnical analyses;</li> <li>b. to apply advanced pavement knowledge in design and analysis of pavements</li> <li>c. to perform critical thinking on design methods and solutions; and</li> </ul>  |
|   | d. to understand the performance of geotechnical structures.  |
| Subject Synopsis/<br>Indicative Syllabus      | Keyword Syllabus         i)       Geotechnical testing and soil behavior (2.5 weeks)         Conventional and advanced lab/field testing in geotechnics, Introduction to centrifuge modelling and particle image velocimetry, Mechanical behavior of soils.         ii)       Constitutive modeling of soils (2.5 weeks)         Introduction of elasticity and plasticity; Nonlinear stress dependent elastic model; Mohr-Coulomb model; Cam-clay and Modified Cam-clay models; advances of soil modeling.         iii)       Advances in geotechnical applications (2 weeks)         Advances in slope stability analysis, foundation (pile group/piled raft) analysis, Uncertainty and reliability approaches in geotechnical engineering. |

|   | iv) Pavement structure and materials (1 week)   |                |   |   |     |        |   |   |
|---|---|----------------|---|---|-----|--------|---|---|
|   | Introduction to pavement type and structure; rheological properties and characterization of bitumen and bituminous materials.   |                |   |   | and |        |   |   |
|   | <u>v)</u> <u>Mechanical models of bituminous pavements (3 weeks)</u><br>Mechanical models of bituminous mixtures; pavement temperature prediction;<br>dynamic traffic loads, pavement responses and distress evolution.   |                |   |   |     | ction; |   |   |
|   | vi) Pavement condition and evaluation (2 weeks)<br>Pavement functional properties; pavement structural properties; non-destructive<br>pavement evaluation techniques, such as falling weight deflectometer and ground<br>penetration radar.   |                |   |   |     |        |   |   |
| Teaching/Learning   | 1. Lectures to deliver teaching materials.  |                |   |   |     |        |   |   |
| Methodology   | 2. Journal papers on new methods, advanced techniques or basic theory.  |                |   |   |     |        |   |   |
|   | 3. Assignments related to the subject contents.   |                |   |   |     |        |   |   |
|   | 4. Project reports  |                |   |   |     |        |   |   |
| Assessment<br>Methods in<br>Alignment with<br>Intended Learning<br>Outcomes | Specific assessment<br>methods/tasks  | %<br>weighting | Intended subject learning outcomes to be assessed |   |     |        |   |   |
|   |   |                | а   | b | с   | d      |   |   |
|   | 1. Continuous<br>Assessment   | 50%            | ~   | ~ | ~   | ~      |   |   |
|   | 2. Individual report on a special study topic   | 50%            | ~   | ~ | ~   | ~      |   |   |
|   | Total   | 100 %          |   |   | •   |        | • | • |
|   | Explanation of the appropriateness of the assessment methods in assessing the intended learning outcomes:<br>Continuous assessment is based on assignment/quiz/test/project paper for all lectures (50%).<br>Each student shall submit an individual report on a special study topic which will be given by a lecturer in his field (50%).<br>Students must attain at least Grade D in the coursework and continuous assessment in order to attain a passing grade in the overall result. |                |   |   |     |        |   |   |

|--|--|------------------------------|-------------------------|------------------------|-----------------------|--------------|
| Teaching/Learning<br>Methodology           | The subject is delivered mainly using lectures which are focused on optimization methods for formulating and solving real-world construction and transportation problems. The lectures need to be supplemented by substantial self-study after class by students of reference materials and other up-to-date technical reports/journal papers recommended by the lecturer(s). The students need to complete a set of assignments and an individual project and presentation.   |                              |                         |                        |                       |              |

|  | Presentation   | 50%                          | ·                       | •                      | · ·                   | Ť            |
|  | Total  | 100 %                        |                         |                        |                       |              |
| Student Study                              | The students will be assessed with two components, i.e. 1. assignments, 2. Written individual project report and oral presentation at the end of the semester. The students will be required to conduct extensive reading after the lecture to complete a set of assignments. Each assignment is designed to cover a particular technical aspect of data analysis. Moreover, an individual project is designed to assess the students' understanding on the critical assessment and effective communication of the results of data analysis in solving real world problems. Hence, the students are considered to be highly effective in achieving the intended learning outcomes a, b, c and d. |                              |                         |                        |                       |              |

|                               | HoD/DoS or his/her delegate for 6 hours/week in any 13-week semester.   |
|                               |   |
|                               | Students are allowed to complete these two credits any time before they graduate.<br>They can choose to complete these two credits in two different semesters or within<br>the same semester, subject to the approval of the Chief Supervisor. Stipend<br>recipients are allowed to fulfill part of their departmental training requirement<br>through the completion of these compulsory training credits. |
|                               | For students who are required to undertake teaching supporting activities, they should be required to complete the training programmes organised by the EDC and ELC before the commencement of any teaching supporting activities (for details, please refer to item 10 below).   |
| Assessment                    | Chief Supervisors are required to:  |
| Methods in                    |   |
| Alignment with                | a. ensure that the activities are structured and can be assessed properly;  |
| Intended Learning             | b. submit, at the end of the training session, an assessment report on the  |
| Outcomes                      | performance of the relevant student(s), with details of activities undertaken   |
|                               | and an overall assessment grade of Pass or Fail.  |

# <u>Departmental Subjects</u> Land Surveying and Geo-Informatics

| Subject Code   | LSGI631   |
|--|---|
| Subject Title  | Attendance in Research Seminars/Workshops/Conferences I   |
| Credit Value   | 1   |
| Level  | 6   |
| Pre-requisite /<br>Co-requisite/<br>Exclusion                            | Nil   |
| Objectives   | This subject is intended to enhance the exposure and horizon of the students in research and other related areas.   |
| Intended Learning<br>Outcomes  | To develop advanced and effective communication skills for both academic and non-<br>academic communities.  |
| Subject Synopsis/<br>Indicative Syllabus                                 | Full-time students are required to attend at least 10 research seminars per year, in addition to workshops/conferences, and to submit a report, to the Chief Supervisor, of no less than 1,500 words (excluding references) on one of the attended seminars every year.   |
|  | Part-time students are required to attend at least 10 research seminars per two years, in addition to workshops/conferences, and to submit a report, to the Chief Supervisor, of no less than 1,500 words (excluding references) on one of the attended seminars once every two years.  |
|  | The research seminars may or may not be organised by the host department and are expected to last not less than an hour each. The topic of the seminar reported on should not be related directly to the thesis title of the student.   |
| Assessment Methods<br>in Alignment with<br>Intended Learning<br>Outcomes | Chief Supervisors are required to assess the report (with a pass or failure grade).<br>Students who failed to submit a report to the satisfaction of their Chief Supervisor are<br>required to make a re-submission until a pass grade is obtained. The Chief Supervisor<br>has to pass the record of the seminars attended by their students and the report with<br>a pass grade to the Research Office for custody at the end of each academic year.              |
|  | Students are recommended to complete one credit per year (for full-time students) or per two years (for part-time students) to fulfill the above-mentioned requirement, with an overall assessment grade of Pass and Fail. However, as deemed appropriate by the Chief Supervisor, they are allowed to complete at most two credits per year (for full-time students) or per two years (for part-time students) to fulfill the research seminar credit requirement. |

| Subject Code   | LSG1652   |
|--|---|
| Subject Title  | Remote Sensing in Construction, Urban and Environment   |
| Credit Value   | 3   |
| Level  | 6   |
| Pre-requisite /<br>Co-requisite/<br>Exclusion        | Nil   |
| Objectives   | <ul> <li>To provide an understanding of advanced remote sensing technologies, such as<br/>Ground Penetration Radar (GPR), Radar Interferometry (InSAR), Laser Scanning<br/>technology (LiDAR) and hyperspectral remote sensing;</li> <li>To enable students to deeply understand the state-of-the-art research in these<br/>relevant areas;</li> <li>To enable students to properly identify feasible research topics in these areas.</li> </ul>  |
| Intended Learning<br>Outcomes<br>(Note 1)            | <ul> <li>Upon completion of the subject, students will be able to: <ul> <li>Master research theory, technology of advanced remote sensing technology;</li> <li>Understand the applications in Construction, Urban and Environment;</li> <li>Articulate the technologies relating to the integration of disparate sources of acquisition covered in this topic.</li> </ul> </li> <li>Appreciate the effectiveness and limitation of using these technologies in real-world applications.</li> </ul>  |
| Subject Synopsis/<br>Indicative Syllabus<br>(Note 2) | <ul> <li>Ground Penetration Radar (GPR) technology and application in Construction,<br/>Urban and Environment</li> <li>LiDAR technology and applications in Construction, Urban and Environment</li> <li>InSAR technology and applications in Construction, Urban and Environment</li> <li>Multi-spectral remote sensing and applications in Construction, Urban and<br/>Environment</li> <li>Hyperspectral remote sensing and applications in Construction, Urban and<br/>Environment</li> <li>UAV technology and applications in Construction, Urban and<br/>Environment</li> <li>UAV technology and applications in Construction, Urban and Environment</li> <li>Future developments/trends in remote sensing technology.</li> </ul> |
| Teaching/Learning<br>Methodology<br>(Note 3)         | This subject will be taught and learnt through an instructor-student, theory-practice interactive method. The question-oriented teaching method will be used in the classroom to engage with the PhD students. The students will be asked to conduct two problem-oriented projects in this subject, the outcome of which will be shared to the whole class through oral presentation. This will help the PhD students to enhance their project implementation, project management and project presentation skills.  |

Part IV Appendices

#### Appendix A: Research Committees

PolyU currently has 3 tiers of administration for matters related to research, namely the Research Committee, the Faculty Research Committee and the Departmental Research Committee, to govern and discharge duties in relation to research postgraduate studies.

#### A1. Research Committee (RC)

The Hong Kong Polytechnic University Research Committee (RC), a Committee of the Senate, is responsible for, amongst other things, developing research and research-degree policies, regulations and procedures; allocating research funds; and monitoring the progress and quality of research.

#### A2. Faculty Research Committee (FRC)

At Faculty level, the FRC plays an important role in reviewing and developing policies and regulations regarding research and research postgraduate studies and makes recommendations accordingly to the Research Committee. The FRC provides a forum for discussion and debate on issues of significance relating to research and research postgraduate studies, fostering a culture of active research in the Faculty and encouraging further development in line with the University's research policies.

#### A3. Departmental Research Committee (DRC)

Each department has a research committee. The DRC carries out functions as stipulated in the Administrative Procedures for the research degrees offered by The Hong Kong Polytechnic University for research postgraduate students, including but not limited to considering research postgraduate degree candidates, and monitoring the progress of research projects and of research postgraduate students in the Department.

#### Appendix B: FCE Research Theme and Departmental Focused Research Areas

#### **B1. Faculty Research Direction**

With the largest concentration of research expertise in the construction and environment fields in Hong Kong, FCE is at the forefront of multi-disciplinary and cutting-edge research on Sustainable Urban Development. The interdisciplinary research areas of our four departments focus on various aspects of Sustainable Urban Development, which impinge on and are informed by the fields of Construction, Energy, Environment, Urban Hazards Mitigation and Urban Informatics, as illustrated in the chart below. By consolidating and enhancing our strengths in the interlocking areas, the Faculty is well positioned to become a world leader in creating innovative solutions for Sustainable Urban Development and Smart City.

#### **B2.** Focused Research Areas of the Departments

#### Department of Building and Real Estate (BRE)

http://www.bre.polyu.edu.hk/

#### **Construction Health and Safety**

This research area aims to create a safe, healthy, and productive environment (eSHAPE) for construction workers by developing anti-heat stress measures, detecting and mitigating noise hazards, profiling workers' health, developing health and safety measures for workers exposed to silica dust in construction, and reducing the health risks of workers due to hazardous chemicals emission.

A construction uniform with better ultraviolet protection, better breathability and a faster evaporation rate of sweat has been developed for workers who have to toil in hot and humid conditions. Since its launch, the uniform has been adopted by the construction industry. Assessing the level of environmental and physical hazard exposures in the construction industry, and investigating the impacts of different types of chemical and physical hazards on the occupational health of construction workers will better guide occupational health and safety (OHS) policy and measures, applying controls when and where appropriate, as well as informing construction workers about adverse health behaviors.

#### **Digital Construction**

This research area aims to develop digital solutions to ensure successful project delivery of construction projects with minimum time and cost, while maintaining high quality and reducing accidents. The emergence of digital technologies has the potential to greatly improve the project delivery processes. For example, Building Information Modelling (BIM) enables 3D representations of building components and processes. The Internet of Things (IoTs) facilitates information exchange between machines without the need for human intervention. Industrial robotics and 3D printing technologies can automate construction operations.

#### Sustainable Urban Systems

This research area aims to achieve sustainable urban development by conducting scientific studies at a whole range of levels, from industrial to city to districts etc. A 3D spatial analysis of different plot ratio/building height (PR/BH) scenarios on urban skyline, visual effect, shadow and insolation, wind ventilation, and air temperature has enabled decision makers to formulate scientific and rational decisions for sustainable urban development. At the building level, an

energy assessment system for new buildings and a unified decision support system for green retrofit in existing buildings have been developed. At the project level, a RFID-Enabled BIM Platform for Prefabricated Housing Production in Hong Kong has facilitated effective management of the supply chain in prefabricated housing production. This platform has been widely regarded as a very useful tool for information management by stakeholders in the supply chain, including the Housing Authority (the client), Gammon Construction (the contractor), and Wing Hong Shun (the façade supplier). Research in this area is primed to inform the construction of smart cities, which is the foreseeable trend of the future.

#### Department of Building Services Engineering (BSE)

http://www.bse.polyu.edu.hk/

#### **Building Energy Efficiency**

Energy issues in the building and built environments will be addressed in the context of both demand and supply. Enhancing energy efficiency on the demand side by optimized design and smart control of energy systems, and the effective use of renewables on the supply side as well as the innovative use of waste for clean energy generation. Research topics include: robust and optimal design of building HVAC systems; optimal control of building HVAC systems; energy assessment/diagnosis of buildings with deficient high volume information (Big Data); demand management for smart grid; photovoltaic integration; hybrid solar-wind power generation; development of advanced renewable energy technologies; hybrid ground-coupled heat pump applications for air-conditioning in hot-climate region; highly dispersed nanocomposite for selfcleaning photovoltaic panels; green building nanomaterial and novel building envelope technology development; novel solar heat-reflective insulation material based on hollow glass micro-balloon cores with hierarchical porous rutile TiO2 coating; sustainable energy conversion and storage with emphasis on high temperature fuel cells for efficient energy conversion from biofuels or organic waste; planting techniques for enhancing CO2 absorption for urban rain gardens; technology development and economic feasibility of applying new urban bio-refinery to convert solids wastes derived lignocellulosic biomass into biofuels; low-carbon construction processes.

#### **Building Environment**

Research in this area has helped improve indoor and outdoor environments, such as HVAC systems to control indoor air temperature and humidity for thermal comfort and energy efficiency. Improving indoor built environments involves thermal, indoor air quality (IAQ), visual and acoustic aspects. Technology enabling ventilation and sound insulation has been applied in hostels, public housing estates and a private housing estate. For the best possible indoor environment at the least energy consumption, research needs to focus on developing innovative technologies and improving and integrating existing technologies. These include: precise control of indoor thermal parameters; novel ventilation strategy for improved IAQ at the lowest possible energy use; ventilation-enabling sound insulation technologies; novel indoor silencing devices; the use of daylight for energy saving and visual comfort etc. A fundamental understanding of human responses to light stimuli, including visual, non-visual, and behavioral responses, from psychophysical, physiological, and psychological perspectives, is also required. Enhanced wind and thermal comfort in the urban environment can be developed through computational modeling, new design tools and policy reviews. Multi-disciplinary sound quality assessment and improvement strategies for sustainable city design is another focus. This includes the improvement of total thermal, visual, air and sound quality of the neighborhood environment.

#### **Building Safety and Resilience**

With intelligent facilities in tall buildings, traditional aspects of building safety such as structural strength and fire resistance must also include newer concerns, such as interference of lightning bolts with electrical and electronic systems. In collaboration with the Shenzhen Meteorological Bureau, a 362 m-high tower was installed with sensors and measuring systems to provide a unique experimental platform for researching the atmospheric environment, such as enabling the interaction of lightning with modern facilities to be investigated in real scale. As the actual lightning current is captured for testing, practical and effective techniques for protection of buildings against lightning can be developed. The mechanisms and process of fire ignition due to lightning current could also be investigated. To develop fire safety provisions for supertall buildings, fundamental studies on smoke movement can be conducted. An earlier study of wind effects on fires in a supertall building has demonstrated that heat and smoke emitted from a fire in a supertall building spread upward, with air entrained at lower levels. The structural response to fire could be simulated to facilitate an understanding of the progressive collapse mechanisms of tall buildings in large fires that may spread over multiplefloors.

#### **Smart and Resilient Transportation**

Traffic congestion, air pollution, and inclement weather are ongoing problems in many densely populated cities in Asia such as Hong Kong. Their impacts on economic productivity, network resilience, the environment, human health and safety are undeniable. However, due to the topography and the constraints of urban development in Hong Kong, further expansion of the existing road transport network is open to question. *Smart and resilient transportation* addresses the multi-modal transportation needs of society in a sustainable manner. The development of Intelligent Transportation Systems (ITS) is one of the essential steps towards *smart and resilient transportation* in Hong Kong's congested transportation network under uncertainties.

This research area includes developing various advanced solution algorithms for data fusion of different real-time traffic sensor data, robust solution algorithms for on-line estimation of journey times, traffic speeds and traffic states in congested networks with uncertainties, reliability-based path finding algorithm for ITS applications, and computational methods for enhancing network resiliency. The results have contributed to the advancement of the relevant research fields, and at the same time have made significant impacts in Asian cities. Some of the robust solution algorithms developed have already been implemented in the ITS projects in Hong Kong and Bangkok. It is hoped that further research would improve the efficiency and resiliency of traffic systems together with the planning, design and operation of urban infrastructure.

#### Sustainable Urban Environment

Deteriorating air quality, increasing amounts of wastewater and solid waste, and rapidly growing energy consumption have been major environmental problems in densely populated cities such as Hong Kong. These issues pose threats to human health and the ecosystem, and impede the potential for urban development. Owing to their extreme complexity and rising mitigation/treatment costs, the solutions to these issues remain elusive. The research area on *Sustainable Urban Environmental* explores cost-effective pathways of development in theory and in practice for combating these environmental problems in urban cities.

The research area includes studies on the formation mechanism and abatement strategy of atmospheric pollution, the chemical and biological treatment of wastewater, the generation of energy by harnessing wastewater, wood and food waste, and the conversion of different types of waste to construction materials (e.g. Eco-block). The research findings have contributed to the formulation and evaluation of pollution control policies both locally and internationally (*e.g.*, assessment of vehicular emission control and cross-border impact on air quality in Hong Kong

and of air pollution mitigation measures during the Beijing Olympics); the Eco-block technology has been transferred to the private sector and it has been widely used in Hong Kong.

#### **Sustainable Materials and Structures**

The sustainability of urban infrastructure is an issue of great concern to all major cities and particularly high-density cities such as Hong Kong. Research in the area of **Sustainable Materials and Structures** aims to enhance the sustainability of urban infrastructure by minimizing the use of materials and resources (and hence the carbon footprint) per year of service for a given infrastructure project. Researchers from structures, pavements and concrete technology in CEE work synergistically with researchers outside CEE (e.g., researchers in material science, chemistry and computer science) to enable major advances in the area.

The infrastructural use of high-strength materials such as fiber-reinforced polymer (FRP) composites, high-strength steel and ultra-high performance concrete for a new generation of infrastructure has enabled huge savings in construction materials. Research on long-life infrastructure by means of high-durability materials and/or advanced monitoring and retrofitting techniques is another related aspect. In ensuring the long-service life of infrastructure, smart technologies are needed to equip our infrastructure with the ability to sense, respond to and recover from severe environments (e.g., marine environments) and extreme loadings (e.g., typhoons and earthquakes).

Despite the use of high-performance materials and advanced technologies to extend the lifespan of infrastructure, any structure/facility will still have a finite life. Therefore, end-of-life strategies for demolition wastes are crucial for the sustainability of infrastructure. How to recycle demolition and other wastes into new structures and useful products is also part of this research area.

#### **Urban Geohazards and Mitigation**

There are over 60,000 registered cut-slopes in Hong Kong, but there are numerous slopes in natural terrain in Hong Kong. Our research efforts are divided into hazard analyses of cut-slopes and their remediation, and hazard analysis and remediation of natural terrain in terms of debris flows. Fatal cut-slope failures have been rapidly reducing in recent years. Thus, the focus has been shifted to the study and monitoring of slopes in natural terrains.

Our efforts on geohazards and mitigation relating to landslides can be classified into two main domains: (1) theoretical, experimental and numerical analyses on landslides, rockfalls and debris flows hazards; (2) Field monitoring technologies for slope monitoring. First, numerical, theoretical, experimental analyses and field studies on debris flow, slope failures, rockfall and various innovative slope stabilization methods/materials were conducted at PolyU. Secondly, GIS,
GPS, IOT, fibre optic sensors and cloud computing have been employed for slope monitoring in the last few years. Commercial software "Slope 2000" and "Slope3D" were developed and approved by the Buildings Department, and have been used in many large scale/national projects all over the world. A Collaborative Research Fund was granted by RGC for building a large scale debris flow flume.

# Department of Land Surveying and Geo-Informatics (LSGI)

http://www.lsgi.polyu.edu.hk

#### **Smart Positioning and Mobility**

Navigation technologies are the core technologies to support a mobile internet, Location Based Services (LBS), and the Internet of things (IoT). Satellite based navigation systems (i.e. GPS, GLONASS, Beidou, and Galileo), as the backbone of navigation technologies, have become the fundamental infrastructure for national security and economic growth. Smart mobility is crucial for a smart city by reducing traffic congestion and pollutions, improving transfer speed and safety, and reducing transfer cost. LSGI has conducted research on navigation technologies and smart mobility for more than 30 years. A Navigation Laboratory has been established since 1999. In recent years, research on key issues (i.e. GNSS signal shadowing, GNSS multipath, and seamless positioning) for urban positioning and navigation technologies has supported economic development in Hong Kong. As a satellite navigation system developed in China, Beidou has been integrated with other navigation systems to improve navigation performance in urban areas and to promote the applications of the Beidou system internationally. A public transport enquiry system has also been developed and adopted by the Transport Department for public use since 2010.

#### Spatial Big Data Modelling and Analytics

Spatial big data modelling and analytics is based on a) the emerging research topic of big data, especially spatial big data in the geographic information science (GIS) community, and b) the related research accumulation of LSGI in the areas of spatial, temporal and dynamic data modelling, and spatial analyses in GIS. The proposed focus will contribute to the research and development of urban informatics in smart city with respect to data modelling and analysis. Strategies for this research focus include (i) identifying the need for spatial big data modelling and analytics in the context of smart city development; (ii) forming an inter-disciplinary research team at PolyU on spatial big data analytics; (iii) applying for large research grants related to this research focus; (iv) developing solutions for spatial big data modelling for heterogeneous, multi-resolution sources of spatial data; (v) creating spatial data models for an integrated indoor and outdoor environment; (vi) proposing analytical methods for dynamic urban data; (vi) analyzing and predicting urban mobility and dynamic behavior based on spatial big data.

#### **Urban Sensing and Measurement**

Research in this area has included urban heat island research, urban atmosphere monitoring, urban hazard monitoring, urban utility and infrastructure monitoring and management, urban 3D mapping, and 3D modelling for urban applications. The research prospect for the future will include (i) urban remote sensing for environment monitoring and modelling; (ii) urban remote

sensing for hazard/deformation monitoring of urban infrastructures; (ii) urban underground utility monitoring and management; (iii) advanced photogrammetric hardware and software systems for near real-time 3D measurement of urban scenes; (iv) more automated 3D/4D city modelling with a high level of details from multiple-source remote sensing datasets; (v) developing a spatial data infrastructure for smart city development in Hong Kong.

# Appendix C: Faculty and University Central Research Facilities

## **C1. Faculty Research Facilities**

The Faculty and its Departments provide tremendous funding for research infrastructure development and enhancement. Please visit the websites of our four departments for details of the state-of-the-art equipment and facilities of our 60 research laboratories.

# Department of Building and Real Estate (BRE)

# BRE Smart Construction Laboratory The Smart Construction Laboratory has been providing industrial services covering and extending the use of Building Information Modelling (BIM), process simulation solutions and professional training to the construction industry. Ng Wing Hong Laboratory for Sustainable City This high-level laboratory provides an information technology infrastructure for examining the sustainable development of Hong Kong at the building and city level. The laboratory facilitates the archiving, processing and retrieval of databases and information in multi-media formats. Energy Laboratory The laboratory provides facilities to support cutting-edge scientific research on advanced energy systems, such as high temperature fuel cells for energy conversion, metal air batteries for energy storage and electrochemical systems for low-grade heat harvesting. Building Technology Laboratory The laboratory provides demonstration classes and hands-on building technology experiments on structural mechanics, concrete testing and non-destructive techniques for building diagnostics and inspection. Multimedia Communication Centre The Multimedia Communication Centre (MMCC) is an ideal learning platform for staff and students to develop their multimedia skills by providing a comprehensive set of multimedia equipment, the latest software, technical support and training programmes. Project Studios The two studios are interconnected with a sliding partition, so they can be used either as two separate rooms or combined into one. They are designed to provide specialist teaching rooms for group project work using the tools of the trade commonly found in construction firms. IT Teaching Room Students can use any of the PC stations in the IT Teaching Room on a first-come, firstserved basis during non-teaching sessions.

# Department of Building Services Engineering (BSE)

| BSE | Acoustics Laboratory   |
|-----|--|
|     | This lab is equipped with all essential and advanced equipment for the study and measurement of sound and vibration (both indoor and outdoor). There is an acoustics testing chamber that conforms to ISO/BS/ASTM standards for testing  |
|     | sound transmission loss, sound absorption and machine sound power.   |
|     | <b>Design and Development Centres</b><br>Computer-Aided Design (CAD) and drafting forms an important part of the<br>Department's teaching programmes. The facilities in the Design and Development<br>Centres include the latest Pentium computers and various plotting and printing<br>facilities linked by a LAN. Peripherals include scanners, digitisers, large plotters and<br>various printing facilities. It also provides computing facilities for students.   |
|     | <b>Electrical Services Laboratory</b><br>Facilities in the electrical services lab are suitable for testing and commissioning electrical installations, testing electrical equipment, conducting power quality analyses (harmonics, transients, etc.) and electro-magnetic field measurements and lightning detecting and monitoring systems, among others.  |
|     | <b>Fire Engineering Laboratory</b><br>There are two fire chambers that are well-equipped with instruments such as thermocouples, velocity sensors, oxygen analysers and gas analysers for conducting measurements in full-scale burning tests. Fire protection systems are installed for studying system performance. Wind tunnels are available for evaluating the thermal sensitivities of sprinkler heads and fire detectors.   |
|     | <b>HVACR Laboratory</b><br>Air conditioning systems provide comfortable interior thermal environments for<br>building occupants. The process involves the removal of heat and humidity by<br>different types of air handling equipment. Fans are used to distribute the conditioned<br>air to various interior zones of a building through air ducts. In the HVACR lab, students<br>can study the operating characteristics of fans and the air-flow disturbance along an<br>air duct using the Fan Test Rig and the Air Duct and Damper Test Rig. Other<br>experimental equipment includes a Refrigeration Laboratory Unit, a Bench Top<br>Cooling Tower and an Air Conditioning Laboratory Unit. |
|     | Indoor Environmental Quality Laboratory<br>Most of the test rigs in this lab are portable, comprising various gas analysers,<br>temperature, humidity and air flow sensors for measurements in occupied spaces,<br>on air-side systems, etc. The manikin is an important piece of equipment for<br>investigating thermal comfort and indoor air quality. Integrated analysis of the data   |

BSE in different areas such as thermal comfort, indoor air quality and subjective human responses can be carried out.

#### Indoor Air Quality (Bioaerosal) Laboratory

The Laboratory at Biological Safety Level 2 (BSL-2) is equipped with a Class II biological safety cabinet, as stated in the "Guidelines on Biosafety in the Clinical Laboratory" issued by the Department of Health (2005). The lab is also equipped with a wide range of bioaerosol sampling facilities for laboratory and field studies, including single stage impactors, Anderson samplers, biotest RCS plus, an incubator and an autoclave.

#### Intelligent Building Laboratory

The Intelligent Building (IB) Laboratory facilities include a comprehensive Honeywell IB system, a full set of Schneider automation systems, a variety of measurement instruments for building energy auditing and high-performance computers. The IB lab provides test facilities for teaching and learning as well as for R&D on intelligent building technologies, the development of advanced building system control, energy management, diagnosis strategies and communication software.

#### Lighting Laboratory

The Lighting Lab's goniophotometer, integrating sphere and spectroradiometer help to characterise various photometric (e.g., luminous flux, luminous intensity distribution) and colorimetric (e.g., spectral power distribution, correlated colour temperature, chromaticity coordinates, CIE Colour Rendering Index, IES TM-30-15, etc.) quantities for light sources and luminaires. The High Dynamic Range Imaging System allows us to perform luminance and glare analyses for exterior and interior luminous environmental assessments. In addition, the 14-channel spectrally tunable LED lighting system, spectroradiometer, spectrophotometer and standard viewing booth allow us to simulate different lighting conditions and to perform colour characterisation using different materials and surface colours.

# Lightning Physics and Protection Laboratory

This lab facilitates research on the formation, detection of and protection from lightning. It includes various instruments specially designed for lightning research, such as slow and fast antennae and a magnetic loop antenna for measuring lightning-caused electric fields, a lightning location system, high-speed camera, broadband interferometer system and lightning current measuring system. It also includes various instruments for general use, such as high-speed oscilloscopes and data recorders. Due to the nature of lightning, these instruments are usually installed in fields outside the lab for experiments during the summer. The lab also has various sets of software for modelling lightning processes.

#### Low-carbon Building Technology Laboratory

The Low-carbon Building Technology Laboratory consists of a stainless-steel cladded

| BSE | environmental chamber the size of a typical office, and a stand-alone air-conditioning<br>system equipped with three thermal manikins and temperature, aerosol and VOC<br>sensors. The lab accommodates a variety of experimental studies.   |
|-----|--|
|     | <b>Multi-Function Chamber Laboratory</b><br>The Multi-Function Chamber Laboratory is equipped with a main heating and cooling<br>plant comprising a chiller, a boiler, hot and chilled water pumps, an air handling plant<br>and a main supervisory control and data acquisition centre. The temperature,<br>relative humidity and airflow within the chamber can be precisely controlled over a<br>wide range of set-point conditions for various precision measurements. |
|     | <b>Piped Services Laboratory</b><br>This lab provides facilities for testing and commissioning water supply and drainage systems for buildings. Bench-scale test rigs are set up to assess the performance and efficiency of various system components.  |
|     | <b>Renewable Energy Laboratory</b><br>Established in August 2014, the lab enables fundamental and applied research on solar energy materials and green building materials in collaboration with industry and leading academic institutions, providing advanced and innovative technological solutions for the generation of renewable energy and a sustainable built environment.  |
|     | <b>Solar Simulation Laboratory</b><br>The lab provides facilities for testing solar energy devices for thermal and photovoltaic applications. The solar simulator is mainly used for the research and development of solar energy applications in buildings, product tests of solar energy equipment and heat loss measurements of various building façade elements and devices.   |

#### Department of Civil and Environmental Engineering (CEE)

CEE The Department manages 27 laboratories and 2 workshops (mechanical and electronic) to provide a controlled environment to support teaching, research and services to the community. The Department has the following laboratories and workshops under different units. **Construction and Transportation Unit** Hong Kong Road Research Laboratory Transport and Highway Engineering Laboratory **Environmental Engineering Unit** Air Pollution Laboratory \_ Atmospheric Research Laboratory \_ Carbon Analysis and Filter Handling Clean Room **Environmental Chamber** \_ Noise and Safety Laboratory/ Semi-anechoic Chamber Odour Research Laboratory Water and Waste Teaching Laboratory Water and Waste Research Laboratory Water Analysis Laboratory \_ Advanced Environmental Microbiology Laboratory **Bioenergy Research Laboratory** Laboratory for Advanced Environmental Studies \_ **Geotechnical Engineering Unit** Geology Laboratory Soil Mechanics Laboratory Rock Mechanics Laboratory \_ Hydraulic Engineering Unit Hydraulics Laboratory Hydraulics Laboratory (Eco-hydraulics Research Center) Hydraulics Laboratory (Sensors Development Office) Structural Engineering Unit Concrete Materials Laboratory Concrete Technology Laboratory -Light Structures Laboratory - Structural Engineering Research Laboratory Structural Dynamics Laboratory Structural Health Monitoring Laboratory Workshops **Electronic Workshop** Mechanical Workshop \_ Others **Computer Room**

|------|---|
|      | This lab aims to implement high-impact and high-quality research through cross disciplinary collaborations among faculties/schools and other UGC institutions, provide new insight into a wider range of research areas, and maximize their impact and benefit to society. Apart from continuing to focus on the environmental applications of the state-of-the-art remote sensing systems, as well as the development of techniques to enhance the usefulness of these systems, the lab also expands its research endeavours to the application of remote sensing technologies in teaching and learning. |
|      | <b>Cadastre Survey Laboratory</b><br>This lab holds various district demarcation sheets, survey sheets and land records from the 1960s up to the present. The Cadastre lab has an A2 scanner and a 3D aerial photo-viewing device.  |
|      | <b>Hydrographic Survey Laboratory</b><br>The hydro lab has evolved into a modern laboratory to meet various university teaching, research and consulting requirements. It has a suite of advanced instruments and software for teaching, research and consulting services.  |
|      | Navigation Laboratory<br>Jointly set up by the Department and Nanjing University of Aeronautics and<br>Astronautics (NUAA), the laboratory supports four main areas of research: integrated<br>navigation systems; GNSS and positioning; and intelligent transportation systems<br>(ITS) and location based services (LBS).   |
|      | Laboratory for Deformation and Geohazards Studies<br>This lab facilitates research in developing new technologies such as GNSS (Global<br>Navigation Satellite Systems), InSAR (Interferometric Synthetic Aperture Radar) and<br>in-situ sensor based technologies, and in studying geohazards such as landslides,<br>earthquakes, land subsidence and structural health. The laboratory is equipped with<br>advanced hardware and software.  |
|      |   |
|      |   |
|      |   |

# C2. University Research Facilities

#### University Research Facility in 3D Printing (U3DP)

The University Research Facility in 3D Printing (U3DP) aims at providing all-round support for PolyU staff, researchers and students in applying various types of 3D printing technologies to excel their research works and academic study. It serves as a technology and knowledge hub of 3D printing technologies to unleash students' imagination for innovation and enhance their interest in design and make. It also opens up new initiative for research and industrial collaboration.

#### University Research Facility in Behavioral and Systems Neuroscience (UBSN)

The University Research Facility in Behavioral and Systems Neuroscience (UBSN) is a state-of-theart think tank and interdisciplinary technological platform supporting the research endeavors of PolyU's principal investigators and researchers as well as those from other higher education institutions in Hong Kong. It serves as a key training hub for all who are pursuing scientific enquiry in neuroscience and related disciplines.

# University Research Facility in Big Data Analytics (UBDA)

The University Research Facility in Big Data Analytics (UBDA) aims to provide an infrastructure with software tools and offer an open platform for cross-disciplinary collaboration among researchers and external partners to develop, support, service and sustain research into big data analytics. The UBDA infrastructure has 5 layers, including the Storage Layer, Network Layer, Computing Cluster Layer, Application Layer and Service Layer.

# University Research Facility in Chemical and Environmental Analysis (UCEA)

The University Research Facility in Chemical and Environmental Analysis (UCEA) provides an interdisciplinary platform for chemical and environmental research with a total of 18 major equipment located in 9 different laboratories. The collection of cutting-edge equipment, ranging from high resolution mass spectrometer, solid state Nuclear Magnetic Resonance (NMR) spectrometer to third generation DNA sequencer, encourages the research atmosphere and nurture collaboration from experts in different background.

# University Research Facility in Life Sciences (ULS)

The University Research Facility in Life Sciences (ULS) provides access to advanced instruments for conducting research in the life sciences, facilitating multidisciplinary research and innovations, maintaining core facilities, and training research staff and students.

# University Research Facility in Materials Characterization and Device Fabrication (UMF)

The University Research Facility in Materials Characterization and Device Fabrication (UMF) serves as a catalyst for multidisciplinary education and innovations, coordinating activities, maintaining core and shared facilities, training students, and fostering collegial exchanges of expertise.
